Refractory Organic Substances in the Environment Fritz Hartmann Frimmel, Gudrun Abbt-Braun, Klaus G. Heumann, Berthold Hock, Hans-Dietrich Lüdemann, Michael Spiteller, 2008-01-08 Refractory organic substances ROS are an essential part of the biogeochemical carbon cycle Wherever there is life on earth there will also be ROS in the form of poorly biodegradable leftovers of organisms and as a source for new life Furthermore it is now beyond doubt that ROS are closely related to the carbon intensity identified as one of the driving forces in the dynamics of green house gas emission such that ROS play a key role in sustainable development Refractory Organic Substances in the Environment provides the results of six years of top priority research funded by the Deutsche Forschungsgemeinschaft DFG This research program investigated the structure and function of ROS in different parts of the environment from a chemical physical biological and soil scientific point of view It included the first systematic study of a set of reference samples from Central Europe originating from a bog lake soil seepage water groundwater and from the wastewaters of a brown coal processing plant and a secondary effluent Thus this work not only highlights the structural features obtained from the application of advanced analytical tools but also the function in anthropogenically influenced aquatic systems and soils Of special interest to students and researchers in life sciences Refractory Organic Substances in the Environment F. Use of Humic Substances to Remediate Polluted

Environments: From Theory to Practice Irina V. Perminova, Kirk Hatfield, Norbert Hertkorn, 2006-04-07 Effective remediation of polluted environments is a priority in both Eastern and Western countries In the U S and Europe remediation costs generally exceed the net economic value of the land As a result scientists and engineers on both sides of the Atlantic have aggressively tried to develop novel technologies to meet regulatory standards at a fraction of the costs In situ remediation shows considerable promise from both technical and economic perspectives In situ technologies that deploy natural attenuating agents such as humic substances HS may be even more cost effective Numerous studies have shown humics capable of altering both the chemical and the physical speciation of the ecotoxins and in turn attenuate potential adverse environmental repercussions Furthermore the reserves of inexpensive humic materials are immense Which suggests HS portend great promise as inexpensive amendments to mitigate the environmental impacts of ecotoxins and as active agents in remediation To elucidate emerging concepts of humics based remediation technologies we organized the NATO Advanced Research Workshop ARW entitled Use of humates to remediate polluted environments from theory to practice held on September 23-29 2002 in Zvenigorod Russia see the web site <http://www.mgumus.chem.msu.ru/arw>
