**Medicus**, 1994 *Textbook of Personalized Medicine* Kewal K. Jain, 2009-08-29 Personalized medicine which simply means selection of treatment best suited for an individual involves integration and translation of several new technologies in clinical care of patients The scope is much broader than indicated by the term genomic medicine because many non genomic factors are taken into consideration in developing personalized medicine Basic technologies for personalized medicine of which molecular diagnostics has the biggest share are mentioned briefly and appropriate references are given for further information Commercial aspects are discussed briefly in a chapter and detailed analysis of markets and companies involved in personalized medicine is presented in a special report on this topic There is increasing interest in personalized medicine Considerable advances have taken place in molecular biology and biotechnology to make personalized medicine a viable option but some misconceptions still exist both in the academic and commercial sectors There is lack of a suitable source of information that provides both the fundamentals as well as applications of personalized medicine As the latest version of the first monograph on personalized medicine published in 1998 this volume Textbook of Personalized Medicine summarizes the author's efforts during the past decade as well as reviews selected studies done during this period in a readable format for the physicians and scientists It is hoped that physicians pharmacists scientists and interested lay readers with basic scientific knowledge will find this book useful

Monoclonal Antibodies James W. Goding, 1996-02-26 Monoclonal Antibodies now

have applications in virtually all areas of biology and medicine and much of the world's biotechnology industry has its foundations in the exploitation of this technology. The Third Edition of this well established book meets the needs of both newcomers to the area and experienced researchers by providing an integrated treatment of both the production and application of monoclonal antibodies. As in previous editions detailed and critical accounts of the theory, production, purification, fragmentation, storage and radiolabelling of monoclonal antibodies are given along with descriptions of their use in antigen characterization, affinity chromatography and immunofluorescence. The present volume has been comprehensively updated to cover recent rapid advances particularly with respect to the applications of molecular biology, the use of antibodies in cloning and heterologous expression of genes, immunohistology and phage display libraries. Since the previous edition there has been a growing trend towards the replacement of procedures using radioactive isotopes and the current edition incorporates these newer technologies. The text is oriented towards problems solving and makes it easy to adapt each procedure to individual needs. Extensive cross referencing, a glossary and a comprehensive index make this book an essential reference. This book will be vital both for laboratories already producing or using monoclonal antibodies and for workers in many disciplines who are contemplating their use.
