Mimicry In Plants And Animals:

Mimicry in Plants and Animals Wolfgang Wickler, 1968 **Plant-Animal Communication** H. Martin Schaefer, Graeme D. Ruxton, 2011-04-07 Communication is an essential factor underpinning the interactions between species and the structure of their communities Plant animal interactions are particularly diverse due to the complex nature of their mutualistic and antagonistic relationships However the evolution of communication and the underlying mechanisms responsible remain poorly understood Plant Animal Communication is a timely summary of the latest research and ideas on the ecological and evolutionary foundations of communication between plants and animals including discussions of fundamental concepts such as deception reliability and camouflage It introduces how the sensory world of animals shapes the various modes of communication employed laying out the basics of vision scent acoustic and gustatory communication Subsequent chapters discuss how plants communicate in these sensory modes to attract animals to facilitate seed dispersal pollination and carnivory and how they communicate to defend themselves against herbivores Potential avenues for productive theoretical and empirical research are clearly identified and suggestions for novel empirical approaches to the study of communication in general are outlined *Mimicry in Plants and Animals. Translated From the German by R.D. Martin* Wolfgang Wickler, 1968 *Floral Mimicry* Steven D. Johnson, Florian P. Schiestl, 2016 This is the first definitive book on floral mimicry providing a wider treatise on floral adaptation and plant evolution **Mimicry in Plants and Animals** Wolfgang Wickler, 1978 **Floral Mimicry** Steven D. Johnson, Florian P. Schiestl, 2016-10-13 Mimicry is a classic example of adaptation through natural selection The traditional focus of mimicry research has been on defence in animals but there is now also a highly developed and rapidly growing body of research on floral mimicry in plants This has coincided with a revolution in genomic tools making it possible to explore which genetic and developmental processes underlie the sometimes astonishing changes that give rise to floral mimicry Being literally rooted to one spot plants have to cajole animals into acting as couriers for their pollen Floral mimicry encompasses a set of evolutionary strategies whereby plants imitate the food sources oviposition sites or mating partners of animals in order to exploit them as pollinators This first definitive book on floral mimicry discusses the functions of visual olfactory and tactile signals integrating them into a broader theory of organismal mimicry that will help guide future research in the field It addresses the fundamental question of whether the evolutionary and ecological principles that were developed for protective mimicry in animals can also be applied to floral mimicry in plants The book also deals with the functions of floral rewardlessness a condition which often serves as a precursor to the evolution of mimicry in plant lineages The authors pay particular attention to the increasing body of research on chemical cues their molecular basis their role in cognitive misclassification of flowers by pollinators and their implications for plant speciation Comprehensive in scope and conceptual in focus Floral Mimicry is primarily aimed at senior undergraduates graduate students and researchers in plant science and evolutionary biology **Edinburgh Companion to**

Defensive (anti-herbivory) Coloration in Land Plants Simcha Lev-Yadun, 2016-10-20 This book presents visual plant defenses camouflage mimicry and aposematism via coloration morphology and even movement against herbivores It is mainly an ideological monograph a manifesto representing my current understanding on defensive plant coloration and related issues The book is not the final word in anything but rather the beginning of many things It aims to establish visual anti herbivory defense as an integral organ of botany or plant science as it is commonly called today I think that like in animals many types of plant coloration can be explained by selection associated with the sensory cognitive systems of herbivores and predators to reduce herbivory It is intended to intrigue and stimulate students of botany plant science and plant animal interactions for a very long time This book is tailored to a readership of biologists and naturalists of all kinds and levels and more specifically for botanists ecologists evolutionists and to those interested in plant animal interactions It is written from the point of view of a naturalist ecologist and evolutionary biologist that I hold considering natural selection as the main although not the only drive for evolution According to this perspective factors such as chance founder effects genetic drift and various stochastic processes that may and do influence characters found in specific genotypes are not comparable in their power and influence to the common outcomes of natural selection especially manifested when very many species belonging to different plant families with very different and separate evolutionary histories arrive at the same adaptation something that characterizes many of the visual patterns and proposed adaptations described and discussed in this book Many of the discussed visual defensive mechanisms are aimed at operating before the plants are damaged i e to be their first line of defense In this respect I think that the name of the book by Ruxton et al 2004 Avoiding Attack is an excellent phrase for the assembly of the best types of defensive tactics While discussing anti herbivory I do remember study and teach physiological developmental aspects of some of the discussed coloration patterns and I am fully aware of the simultaneous and diverse functions of many plant characters in addition to defense
