Number Sense How The Mind Creates Mathematics:

The Number Sense : How the Mind Creates Mathematics Stanislas Dehaene Research Affiliate Institut National de la Sante et de la Recherche Medicale, 1997-11-06 Our understanding of how the human brain performs mathematical calculations is far from complete But in recent years there have been many exciting scientific discoveries some aided by new imaging techniques which allow us for the first time to watch the living mind at work and others by ingenious experiments conducted by researchers all over the world There are still perplexing mysteries how for instance do idiot savants perform almost miraculous mathematical feats but the picture is growing steadily clearer In *The Number Sense* Stanislas Dehaene offers general readers a first look at these recent stunning discoveries in an enlightening exploration of the mathematical mind Dehaene a mathematician turned cognitive neuropsychologist begins with the eye opening discovery that animals including rats pigeons raccoons and chimpanzees can perform simple mathematical calculations and he describes ingenious experiments that show that human infants also have a rudimentary number sense American scientist Karen Wynn for instance using just a few Mickey Mouse toys and a small puppet theater proved that five month old infants already have the ability to add and subtract Further Dehaene suggests that this rudimentary number sense is as basic to the way the brain understands the world as our perception of color or of objects in space and like these other abilities our number sense is wired into the brain But how then did the brain leap from this basic number ability to trigonometry calculus and beyond Dehaene shows that it was the invention of symbolic systems of numerals that started us on the climb to higher mathematics and in a marvelous chapter he traces the history of numbers from early times when people indicated a number by pointing to a part of their body even today in many societies in New Guinea the word for six is wrist to early abstract numbers such as Roman numerals chosen for the ease with which they could be carved into wooden sticks to modern numbers On our way we also discover many fascinating facts for example because Chinese names for numbers are so short Chinese people can remember up to nine or ten digits at a time English speaking people can only remember seven Dehaene also explores the unique abilities of idiot savants and mathematical geniuses asking what might explain their special mathematical talent And we meet people whose minute brain lesions render their mathematical ability useless one man in fact who is certain that two and two is three Using modern imaging techniques PET scans and MRI Dehaene reveals exactly where in the brain numerical calculation takes place But perhaps most important *The Number Sense* reaches many provocative conclusions that will intrigue anyone interested in mathematics or the mind Dehaene argues for instance that many of the difficulties that children face when learning math and which may turn into a full blown adult innumeracy stem from the architecture of our primate brain which has not evolved for the purpose of doing mathematics He also shows why the human brain does not work like a computer and that the physical world is not based on mathematics rather mathematics evolved to explain the physical world the way that the eye evolved to provide sight A truly fascinating look at the crossroads where numbers and neurons intersect

The Number Sense offers an intriguing tour of how the structure of the brain shapes our mathematical abilities and how our mathematics opens up a window on the human mind *The Number Sense* Stanislas Dehaene, 2011-04-29 Our understanding of how the human brain performs mathematical calculations is far from complete In *The Number Sense* Stanislas Dehaene offers readers an enlightening exploration of the mathematical mind Using research showing that human infants have a rudimentary number sense Dehaene suggests that this sense is as basic as our perception of color and that it is wired into the brain But how then did we leap from this basic number ability to trigonometry calculus and beyond Dehaene shows that it was the invention of symbolic systems of numerals that started us on the climb to higher mathematics Tracing the history of numbers we learn that in early times people indicated numbers by pointing to part of their bodies and how Roman numerals were replaced by modern numbers On the way we also discover many fascinating facts for example because Chinese names for numbers are short Chinese people can remember up to nine or ten digits at a time while English speaking people can only remember seven A fascinating look at the crossroads where numbers and neurons intersect *The Number Sense* offers an intriguing tour of how the structure of the brain shapes our mathematical abilities and how math can open up a window on the human mind Provided by publisher **The Number Sense: How the Mind Creates Mathematics** Stanislas Dehaene, 1999-10-30 *The Number Sense* is an enlightening exploration of the mathematical mind Describing experiments that show that human infants have a rudimentary number sense Stanislas Dehaene suggests that this sense is as basic as our perception of color and that it is wired into the brain Dehaene shows that it was the invention of symbolic systems of numerals that started us on the climb to higher mathematics A fascinating look at the crossroads where numbers and neurons intersect *The Number Sense* offers an intriguing tour of how the structure of the brain shapes our mathematical abilities and how our mathematics opens up a window on the human mind **SUMMARY - The Number Sense: How The Mind Creates Mathematics By Stanislas Dehaene** Shortcut Edition, 2021-06-27 Our summary is short simple and pragmatic It allows you to have the essential ideas of a big book in less than 30 minutes By reading this summary you will discover how your brain does math You will also discover that animals also have an innate sense of numbers that babies have mathematical abilities from birth that researchers have been able to identify the areas of the brain involved in mathematical tasks how learning reinforces your innate abilities that learning must be based on how the brain works Year after year studies on children s mathematical abilities are alarming Many students perform poorly in mathematics because they are not mathematicians Yet experimental psychology supported by imaging techniques and neuroscience has shown that all humans are endowed with an innate mathematical knowledge It is education that then brings out differences in performance Are you ready to know how the brain works to better understand its difficulties Buy now the summary of this book for the modest price of a cup of coffee *SUMMARY* Edition Shortcut (author), 1901 **Essentials of WISC-V Assessment** Dawn P. Mind in Motion Barbara Tversky, 2019-05-21 An eminent psychologist offers a major new theory of human cognition movement not language is the foundation of thought When we try to think about how we think we can t help but think of words Indeed some have called language the stuff of thought But pictures are remembered far better than words and describing faces scenes and events defies words Anytime you take a shortcut or play chess or basketball or rearrange your furniture in your mind you ve done something remarkable abstract thinking without words In Mind in Motion psychologist Barbara Tversky shows that spatial cognition isn t just a peripheral aspect of thought but its very foundation enabling us to draw meaning from our bodies and their actions in the world Our actions in real space get turned into mental actions on thought often spouting spontaneously from our bodies as

gestures Spatial thinking underlies creating and using maps assembling furniture devising football strategies designing airports understanding the flow of people traffic water and ideas Spatial thinking even underlies the structure and meaning of language why we say we push ideas forward or tear them apart why we're feeling up or have grown far apart Like Thinking Fast and Slow before it Mind in Motion gives us a new way to think about how and where thinking takes place

Space, Time and Number in the Brain Stanislas Dehaene, Elizabeth Brannon, 2011-07-13 The study of mathematical cognition and the ways in which the ideas of space time and number are encoded in brain circuitry has become a fundamental issue for neuroscience How such encoding differs across cultures and educational level is of further interest in education and neuropsychology This rapidly expanding field of research is overdue for an interdisciplinary volume such as this which deals with the neurological and psychological foundations of human numeric capacity A uniquely integrative work this volume provides a much needed compilation of primary source material to researchers from basic neuroscience psychology developmental science neuroimaging neuropsychology and theoretical biology The first comprehensive and authoritative volume dealing with neurological and psychological foundations of mathematical cognition Uniquely integrative volume at the frontier of a rapidly expanding interdisciplinary field Features outstanding and truly international scholarship with chapters written by leading experts in a variety of fields
