Numerical Analysis 2000 Vol. IV: Optimization and Nonlinear Equations

In most of the papers in this collection, the remark that "nothing at all takes place in the universe in which some rule of mathematics or mathematics does not appear" is attributed to no less an authority than Euler. Simplifying the system a little, we might paraphrase this as: Everything is an optimization problem. While this might be overstating of an overstatement, the statement of exaggeration is certainly reduced if we consider that everything does: Everything is an optimization problem or a system of equations. This observation, even if only partly true, stands as a fitting testament to the importance of the work covered by this volume.

Since the 1970s, much effort has gone into the development and application of powerful algorithms for solving problems in the two areas of optimization and systems of equations. As a result, many different ideas have been proposed for dealing efficiently with (for example) convex minimization and/or very large numbers of variables. Libraries of powerful software now embody the most successful of these ideas, and one objective of this volume is to assist potential users in choosing appropriate software for the problems they need to solve. More generally, however, these collected review articles are intended to provide both researchers and practitioners with insights of the 'state-of-the-art' with regard to algorithms for particular classes of problems. These insights are meant to have the virtue of immediacy through the inclusion of very recent ideas, but they also have sufficient depth of field to show how ideas have developed and how today's research questions have grown out of previous solution attempts.

The most efficient methods for local optimization, both unconstrained and constrained, are still derived from the classical Newton approach. The papers in this collection describe many interesting variations, particularly with regard to the organization of the linear algebra involved. The popular quasi-Newton techniques avoid the need to calculate second derivatives, but gradient-based methods have emerged many elsewhere than these almost purely Hessian-based early descendants. They achieve this, however, either as approximate means of available direct search techniques, which are ignored, the instance, the problems whose function values are subject to uncertainty.

As well as dealing in depth with the various classical, or semi-classical, approaches, the selection of papers in optimization in this volume ensures that newer ideas are also well represented. Thus the reader will find an account of the interest that NLP methods for linear systems are beginning to make upon the subject. The potential of interval mathematics for dealing with the global optimization problem is also discussed, as are the emerging methods and software tools of automatic differentiation for supplying the derivative information needed by most optimization techniques. The volume on optimization would be considered to have the necessary breadth unless the final topic of linear programming (the guest from one of the papers: "unfortunately" the optimization problem itself must

Optimization of Elliptic Systems Pekka Neittaanmaki, Jürgen Sprekels, Dan Tiba, 2007-01-04 The present monograph is intended to provide a comprehensive and accessible introduction to the optimization of elliptic systems This area of mathematical research which has many important applications in science and technology has experienced an impressive development during the past two decades There are already many good textbooks dealing with various aspects of optimal design problems In this regard we refer to the works of Pironneau 1984 Haslinger and Neittaanmaki 1988 1996 Sokolowski and Zolksio 1992 Litvinov 2000 Allaire 2001 Mohammadi and Pironneau 2001 Delfour and Zolksio 2001 and Makinen and Haslinger 2003 Already Lions 19681 devoted a major part of his classical monograph on the optimal control of

partial differential equations to the optimization of elliptic systems Let us also mention that even the very first known problem of the calculus of variations the brachistochrone studied by Bernoulli back in 1696 is in fact a shape optimization problem The natural richness of this mathematical research subject as well as the extremely large field of possible applications has created the unusual situation that although many important results and methods have already been established there are still pressing unsolved questions In this monograph we aim to address some of these open problems as a consequence there is only a minor overlap with the textbooks already existing in the field

Stochastic Adaptive Search for Global Optimization Z.B. Zabinsky, 2013-11-27 The field of global optimization has been developing at a rapid pace There is a journal devoted to the topic as well as many publications and notable books discussing various aspects of global optimization This book is intended to complement these other publications with a focus on stochastic methods for global optimization Stochastic methods such as simulated annealing and genetic algorithms are gaining in popularity among practitioners and engineers because they are relatively easy to program on a computer and may be applied to a broad class of global optimization problems However the theoretical performance of these stochastic methods is not well understood In this book an attempt is made to describe the theoretical properties of several stochastic adaptive search methods Such a theoretical understanding may allow us to better predict algorithm performance and ultimately design new and improved algorithms This book consolidates a collection of papers on the analysis and development of stochastic adaptive search The first chapter introduces random search algorithms Chapters 2-5 describe the theoretical analysis of a progression of algorithms A main result is that the expected number of iterations for pure adaptive search is linear in dimension for a class of Lipschitz global optimization problems Chapter 6 discusses algorithms based on the Hit and Run sampling method that have been developed to approximate the ideal performance of pure random search The final chapter discusses several applications in engineering that use stochastic adaptive search methods

Optimal Control of ODEs and DAEs Matthias Gerdt, 2023-11-06 Ordinary differential equations ODEs and differential algebraic equations DAEs are widely used to model control systems in engineering natural sciences and economy Optimal control plays a central role in optimizing such systems and to operate them efficiently and safely The intention of this textbook is to provide both the theoretical and computational tools that are necessary to investigate and to solve optimal control problems with ODEs and DAEs An emphasis is placed on the interplay between the optimal control problem which typically is defined and analyzed in a Banach space setting and discretizations thereof which lead to finite dimensional optimization problems The theoretical parts of the book require some

knowledge of functional analysis the numerically oriented parts require knowledge from linear algebra and numerical analysis Practical examples are provided throughout the book for illustration purposes The book addresses primarily master and PhD students as well as researchers in applied mathematics but also engineers or scientists with a good background in mathematics The book serves as a reference in research and teaching and hopefully helps to advance the state of the art in optimal control
