**Dynamics of Data Envelopment Analysis** Jati Sengupta, 2013-11-11 Data envelopment analysis develops a set of nonparametric and semiparametric techniques for measuring economic efficiency among firms and nonprofit organizations Over the past decade this technique

has found most widespread applications in public sector organizations. However, these applications have been mostly static. This monograph extends this static framework of efficiency analysis in several new directions. These include but are not limited to the following:

- 1 a dynamic view of the production and cost frontier where capital inputs are treated differently from the current inputs
- 2 a direct role of the technological progress and regress which is so often stressed in total factor productivity discussion in modern growth theory in economics
- 3 stochastic efficiency in a dynamic setting where reliability improvement competes with technical efficiency
- 4 flexible manufacturing systems where flexibility of the production process and the economies of scope play an important role in efficiency analysis and
- 5 the role of economic factors such as externalities and input interdependences.

Efficiency is viewed here in the framework of a general systems theory model. Such a view is intended to broaden the scope of applications of this promising new technique of data envelopment analysis. The monograph stresses the various applied aspects of the dynamic theory so that it can be empirically implemented in different situations. As far as possible, abstract mathematical treatments are avoided and emphasis placed on the statistical examples and empirical illustrations.

**Control Applications of Nonlinear Programming** H. E. Rauch, 2014-05-23

Control Applications of Nonlinear Programming contains the proceedings of the International Federation of Automatic Control Workshop on Control Applications of Nonlinear Programming held in Denver, Colorado, on June 21, 1979. The workshop provided a forum for discussing the application of optimal and nonlinear programming techniques to real-life control problems. The volume covers a variety of specific applications ranging from microprocessor control of automotive engines and optimal design of structures to optimal aircraft trajectories, system identification, and robotics. Comprised of 14 chapters, this book begins by describing the application of nonlinear programming to an optimum design problem coming from mechanical engineering. The reader is then introduced to a nonlinear regulator design for magnetic suspension, optimal control solution of the automotive emission constrained minimum fuel problem, and nonlinear programming for system identification. Subsequent chapters focus on mathematical programming algorithms based on Lagrangian functions for solving optimal control problems, computer-aided design via optimization, optimal and suboptimal control of oscillating dynamical systems, and the application of nonlinear programming to the solution of optimal output

constrained regulator problems This monograph will be of interest to mathematicians computer scientists and engineers
