Efficient Nitrogen Fertilizer Management to Improve Crop Production Li Wang, Ying Zhao, Jianwei Lu, 2024-05-22 The improvement in global crop production over the past several decades has been

associated with increased use of nitrogen N fertilizer. However, on average, less than 50% of the nitrogen added to croplands globally is harvested as crop product. Inefficient use of N fertilizer by crops will result in substantial agricultural nitrogen losses posing threats to human and ecosystem health. Crop production must increase dramatically to meet the growing demand for food and biofuels projected for 2050. To boost crop yield with lowered environmental cost, the use of high potential crop cultivars and efficient nitrogen fertilizer management are required. Recent advances in N management practices such as enhanced efficiency fertilizer use, improved manure management, and machine deep placement of fertilizer have opened up new strategies to achieve improved crop production with N use reduction. A better understanding of the key crop traits and regulatory processes in response to N fertilizer managements will facilitate the increase in crop yield N use efficiency while minimizing impacts on the environment.

Nutrient Use Efficiency: from Basics to Advances Amitava Rakshit, Harikesh Bahadur Singh, Avijit Sen, 2014-12-26. This book addresses in detail multifaceted approaches to boosting nutrient use efficiency (NUE) that are modified by plant interactions with environmental variables and combine physiological, microbial, biotechnological, and agronomic aspects. Conveying an in-depth understanding of the topic will spark the development of new cultivars and strains to induce NUE coupled with best management practices that will immensely benefit agricultural systems safeguarding their soil, water, and air quality. Written by recognized experts in the field, the book is intended to provide students, scientists, and policymakers with essential insights into holistic approaches to NUE as well as an overview of some successful case studies. In the present understanding of agriculture, NUE represents a question of process optimization in response to the increasing fragility of our natural resources base and threats to food grain security across the globe. Further improving nutrient use efficiency is a prerequisite to reducing production costs, expanding crop acreage into non-competitive marginal lands with low nutrient resources, and preventing environmental contamination. The nutrients most commonly limiting plant growth are N, P, K, S, and micronutrients like Fe, Zn, B, and Mo. NUE depends on the ability to efficiently take up the nutrient from the soil but also on transport, storage, mobilization, usage within the plant, and the environment. A number of approaches can help us to understand NUE as a whole. One involves adopting best crop management practices that take into account root-induced rhizosphere processes which play a pivotal role in controlling nutrient dynamics in the soil-plant-atmosphere continuum. New technologies from basic tools like leaf color charts to sophisticated sensor-based systems and laser land leveling can reduce the dependency on laboratory assistance and manual labor. Another approach concerns the development of crop plants through genetic manipulations that allow them to take up and assimilate nutrients more efficiently as well as identifying processes of plant responses to nutrient deficiency stress and exploring natural genetic variation. Though only recently introduced, the ability of microbial inoculants to induce NUE is gaining in importance as the loss, immobilization, release, and availability of nutrients are mediated by soil microbial processes.
