Armbrecht, J.M. Prendergast, R.M. Coe, 2012-12-06 There has been much popular and scientific interest in the fields of nutrition and aging in recent years As the importance of proper nutrition in children and young adults becomes more fully understood it is natural to wonder if proper nutrition could play a similar role in later life Recent research has indicated that nutrition can potentially intervene in the aging process in at least two ways First studies in animals and humans have shown that nutrition can be used to improve functional status which in turn is related to perceived quality of life Second nutritional manipulation has been used to extend maximal life span in laboratory animals How these interesting findings apply to the human situation remains to be explored The purpose of this book is twofold The first is to present recent advances in our basic knowledge of how nutrition and aging interact with each other The second is to discuss some applications of this knowledge to the care of the elderly patient The interaction between aging and nutrition is complex because each may act on the other in either a synergistic or antagonistic fashion Aging may alter the nutritional status of the elderly by affecting the way nutrients are absorbed and utilized by the body Aging may also influence food intake and therefore nutritional status by decreasing the palatability of food The environment of the elderly may change so they are less likely to eat well balanced meals **Nutrition and Aging** Martha L. Hutchinson, 2012-12-02 Nutrition and Aging is a collection of papers presented at the Fifth Bristol Myers Symposium on Nutrition Research held in Boston Massachusetts from October 31 to November 1 1985 Contributors discuss the significant influence of nutrition on aging and specifically the role of nutrition in preventing and limiting the physical mental and emotional problems associated with the aging process This book reviews findings that include the effects of the aging process on the body's physiological functions and the effects of nutrient intake on organ function Consideration is also given to the gap between the documented nutrient intake and nutrient needs of the elderly as it may influence the aging process The first chapter is a brief overview of the variety of problems that have to be resolved in determining the role of nutrition in aging The discussion then turns to the relationship of nutrition to changes in physiological function during the aging process along with factors that influence the nutrient needs of the elderly The final chapters focus on the impact of nutrition on the etiology of age related degenerative diseases This book will be of interest to scientists as well as students and researchers engaged in nutrition research and its growing

importance to the prevention and treatment of disease **Nutrition, Aging, and the Elderly** D.E. Danford,H.N. The major objective of this book is to review in detail the health problems of the aged and how normal food lifestyle or nutritional and dietary supplements can help treat them. Nutrient requirements for optimum health and function of aging physiological systems are often quite distinct from those required for young people. The special nutrition problems of the aged are intensively researched and tested especially as the elderly become a larger percentage of the population. Many chronic diseases and cancers are found with higher frequency in the aged and it is also widely known that many elderly people use foods and nutrients well above the recommended daily allowance which can be detrimental to optimal health. Explains the evidence supporting nutritional interventions relevant to age related diseases. Reviews the macro and micro nutrient requirements of aging adults and their variables. Describes how alcohol, drugs and caffeine can impact deficiencies also exploring functional food and dietary supplements that can be used for prevention and treatment.

Nutrition and Healthy Aging in the Community Institute of Medicine, Food and Nutrition Board, 2012-06-15. The U S population of older adults is predicted to grow rapidly as baby boomers, those born between 1946 and 1964, begin to reach 65 years of age. Simultaneously, advancements in medical care and improved awareness of healthy lifestyles have led to longer life expectancies. The Census Bureau projects that the population of Americans 65 years of age and older will rise from approximately 40 million in 2010 to 55 million in 2020, a 36 percent increase. Furthermore, older adults are choosing to live independently in the community setting rather than residing in an institutional environment. Furthermore, the types of services needed by this population are shifting due to changes in their health issues. Older adults have historically been viewed as underweight and frail; however, over the past decade, there has been an increase in the number of obese older persons. Obesity in older adults is not only associated with medical comorbidities such as diabetes, it is also a major risk factor for functional decline and homebound status. The baby boomers have a greater prevalence of obesity than any of their historic counterparts and projections forecast an aging population with even greater chronic disease burden and disability. In light of the increasing numbers of older adults choosing to live independently rather than in nursing homes and the important role nutrition can play in healthy aging, the Institute of Medicine (IOM) convened a public workshop to illuminate issues related to community based delivery of nutrition services for older adults and to identify nutrition interventions and model programs. **Nutrition and Healthy Aging in the Community** summarizes the presentations and discussions prepared from the workshop transcript and slides. This report examines nutrition related issues of concern experienced by older adults in the community, including nutrition screening, food insecurity, sarcopenic obesity, dietary patterns for older adults, and economic issues. This report explores transitional care as individuals move from acute, subacute, or chronic care settings to the community and provides models of transitional care in the community. This report also provides examples of successful intervention models in the community setting and covers the

discussion of research gaps in knowledge about nutrition interventions and services for older adults in the community
