Ocean And The Poles The Grand Challenges For European Cooperation:

The Ocean and the Poles Gotthilf Hempel, 1996 **Basic and Applied Research** David Kaldewey, Désirée Schauz, 2018-04-25 Scientific research in different nations particularly after World War II **Science in Society: Climate Change and Climate Policies** Nico Stehr and Hans von Storch, **Eduard Brückner - The Sources and Consequences of Climate Change and Climate Variability in Historical Times** Nico Stehr, 2013-03-09 This anthology of studies by the eminent geographer and climate scientist Eduard Brückner 1862-1927 on anthropogenic climate change and the social political and economic impact of climate variations on societies in historical times assembles his pioneering work in English for the first time. The issues discussed by Brückner are now considered to be among the most pressing facing modern society and climate research. At the turn of the twentieth century Brückner was one of the central protagonists in a vigorous debate in science and society about global climate variability and its political and economic significance. The studies published here were chosen to demonstrate Brückner's wide ranging scientific interest in climate variability, his extensive empirical research and theoretical analysis of climate change, his assessment of contemporary analyses and thinking about anthropogenic climate change such as the widespread concern about desiccation and how he approached the questions of the transfer of scientific knowledge into society. In many ways Brückner was a thoroughly modern scientist convinced for example that the issue of climate change and its impact was of considerable scientific merit and that future climate changes are of great significance for the well being of humankind as well as for the global balance of political and economic relations. Brückner's formidable ideas should have a significant impact on our present views of climate variability and climate impact.

Biogeochemical Cycling and Sediment Ecology J. Gray, William Ambrose Jr., Anna Szaniawska, 2012-12-06 Oceanographic discontinuities e.g. frontal systems, upwelling areas, ice edges are often areas of enhanced biological productivity. Considerable research on the physics and biology of the physical boundaries defining these discontinuities has been accomplished (see I D). The interface between water and sediment is the largest physical boundary in the ocean but has not received a proportionate degree of attention. The purpose of the NATO Advanced Research Workshop ARW was to focus on soft sediment systems by identifying deficiencies in our knowledge of these systems and defining key issues in the management of coastal sedimentary habitats. Marine sediments play important roles in the marine ecosystem and the biosphere. They provide food and habitat for many marine organisms, some of which are commercially important. More importantly, from a global perspective, marine sediments also provide ecosystem goods and services. 2J Organic matter from primary production in the water column and contaminants scavenged by particles accumulate in sediments where their fate is determined by sediment processes such as bioturbation and biogeochemical cycling. Nutrients are regenerated and contaminants degraded in sediments. Under some conditions, carbon accumulates in coastal and shelf sediments and may be removed from the carbon cycle for millions of years, having a potentially significant impact on global climate change. Sediments also protect coasts. The economic value of

services provided by coastal areas has recently been estimated to be on the order of $12\,568\,910\,y\,3J$ far in excess of the global GNP

Computer Modelling in Atmospheric and Oceanic Sciences Peter K. Müller, 2013-03-09 The book describes what these models are what they are based on how they function and then most innovatively how they can be used to generate new useful knowledge about the environmental system Discusses this generation of knowledge by computer models from an epistemological perspective and illustrates it by numerous examples from applied and fundamental research Includes ample technical appendices and is a valuable source of information for graduate students and scientists alike working in the field of environmental sciences

From Decoding Turbulence to Unveiling the Fingerprint of Climate Change Hans von Storch, 2022-06-01 This open access book serves as a reference for the key elements and their significance of Klaus Hasselmann's work on climate science and on ocean wave research all based on a rigorous and deeply physical thinking It summarizes the original articles mostly from the 1970 and 1980s some of which are hard to find nowadays and brings them in a present day context From 1975 until 2000 he was founding Director of the Max Planck Institute of Meteorology which he made to one of the world leading academic institutions He first made the issue of anthropogenic climate change accessible to analysis and prediction and later transformed climate science into a significant factor in forming public policy The book is written by co workers and colleagues of Klaus Hasselmann who many under his immediate supervision joined him in this effort With this background they present the key achievements and assess the significance of these for the present state of knowledge and scientific practice

Operational Oceanography H.W.A. Behrens, J.C. Borst, J.P. van der Meulen, L.J. Droppert, J.H. Stel, 1997-12-12 GOOS is an international programme for a permanent global framework of observations modelling and analysis of ocean variables which are needed to support operational services around the world The EuroGOOS strategy has two streams the first is to improve the quality of marine information in European home waters and the second is to collaborate with similar organisations in other continents to create a new global ocean observing and modelling system that will provide the open ocean forecasts needed to achieve the best possible performance by local marine information services everywhere The EuroGOOS strategy envisages our national agencies making a major contribution to that challenging task of globalizing ocean forecasting The conference also provided an opportunity to take stock of the state of marine science and technology in Europe relevant to the EuroGOOS strategy and the state of information services and customer needs

Models in Environmental Research Hans von Storch, 2012-12-06 In most natural sciences modeling is a widespread method of gaining new knowledge about natural and technical systems This book analyses the concepts of model and modeling in different fields of research The different methods of modeling as well as the potentials and limits of this concept are reflected and discussed The book presents a variety of modeling techniques from mathematical models in climatology meteorology or oceanography to methods used in morphology decision making in ecology and physical modeling in oceanography In this broad overview regarding modeling the book is unique
