Speight, Peter A. Henderson, 2013-04-30 This book began life as a series of lectures given to second and third year undergraduates at Oxford University These lectures were designed to give students insights as to how marine ecosystems functioned how they were being affected by natural and human interventions and how we might be able to conserve them and manage them sustainably for the good of people both recreationally and economically This book presents 10 chapters beginning with principles of oceanography important to ecology through discussions of the magnitude of marine biodiversity and the factors influencing it the functioning of marine ecosystems at within trophic levels such as primary production competition and dispersal to different trophic level interactions such as

herbivory predation and parasitism The final three chapters look at the more applied aspects of marine ecology discussion fisheries human impacts and management and conservation Other textbooks covering similar topics tend to treat the topics from the point of view of separate ecosystems with chapters on reefs rocks and deep sea This book however is topic driven as described above and each chapter makes full use of examples from all appropriate marine ecosystems The book is illustrated throughout with many full colour diagrams and high quality photographs The book is aimed at undergraduate and graduate students at colleges and universities and it is hoped that the many examples from all over the world will provide global relevance and interest Both authors have long experience of research and teaching in marine ecology Martin Speight s first degree was in marine zoology at UCNW Bangor and he has taught marine ecology and conservation at Oxford for 25 years His research students study tropical marine ecology from the Caribbean through East Africa to the Far East Peter Henderson is a Senior Research Associate at the University of Oxford and is Director of Pisces Conservation in the UK He has worked on marine and freshwater fisheries as well as ecological and economic impacts and exploitation of the sea in North and South America as well as Europe

increasing emission of carbon dioxide due to rapid industrialization urbanization unplanned tourism and alteration of land
use pattern is causing unprecedented changes to marine biodiversity Irrespective of political philosophy nation caste sex and
religion mankind is under the appalling shadow of climate change Today nature based approaches for the mitigation of
climate change are increasingly accepted as part of the low cost solution Thrust has been given by several scientific
communities to assess the magnitude and viability of carbon sequestering potential of plants Coastal producer communities
like mangroves salt marsh grass seagrass beds and seaweeds absorb atmospheric carbon dioxide during the process of
photosynthesis This carbon known as the blue carbon is thus associated with the marine and estuarine ecosystems However
a number of gaps in our scientific knowledge on blue carbon domain still exist Molluscs coral reefs phytoplankton which are
amongst the important storehouses of carbon have not been addressed Very few scientific studies on the carbon stored in
these valuable natural vaults have been performed and no data bank is available on their carbon sequestering capacity on

global basis The methodologies for assessing blue carbon stock also need further standardization so that credit from blue carbon reservoir is accepted by the International bodies in the form of a concrete policy It is a matter of great appreciation that Conservation International CI the International Union for Conservation of Natural Resources IUCN and the Intergovernmental Oceanic Commission IOC of UNESCO is collaborating with governments research institutions non governmental and international organizations and communities around the world to develop management approaches financial incentives and policy mechanisms for ensuring conservation and restoration of blue carbon ecosystems and implement projects around the world that demonstrate the feasibility of blue carbon accounting management and incentive agreements The present book has critically presented the data bank for each community of blue carbon not merely in the form of text description but also through case studies that are the outcomes of research projects and pilot programmes
