Acquired Long QT Syndrome A. John Camm, Marek Malik, Yee Guan Yap, 2008-04-15 In recent years there has been considerable interest in the diagnosis and understanding of ventricular repolarisation particularly the QT interval prolongation and abnormal T and T U wave morphology associated with torsades de pointes Advances in ion channel cloning have greatly improved our understanding of the role of ionic channels in mediating cardiac repolarisation Unfortunately it is increasingly recognised that a number of drugs both those associated with altering repolarisation and others for non cardiac conditions can increase the propensity for polymorphic ventricular tachycardia syncope and even ventricular fibrillation and sudden death In this volume arrhythmia specialists from St George's Hospital Medical School London discuss the mechanisms behind QT prolongation and torsades de pointes They focus particularly on the risk of individual cardiac and non cardiac drugs in provoking long QT syndrome providing a comprehensive review which will be useful for all electrophysiologists treating polymorphic ventricular tachycardias and will expose important regulatory issues for pharmaceutical authorities and for the wider medical community *European Heart Journal Supplements*, 1999

Doevendans, Robert S. Reneman, Marc van Bilsen, 2013-04-17 Improving our insights into the genetic predisposition to cardiovascular disease is one of the most important challenges in our field in the next millennium not only to unravel the cause of disease but also to improve the selection of patients for particular treatments Nowadays for example subjects with a cholesterol above a particular plasma level are exposed to a cholesterol lowering regime based upon the beneficial outcome of epidemiological studies which include subjects not prone to the disease despite a plasma cholesterol above the accepted level Identification of the patients who are genetically predisposed to the consequences of this disorder will reduce the number of subjects unnecessarily treated and hence the costs of health care Because in most cardiovascular diseases the genetic component is a consequence of more than one gene defect only limited progress has as yet been made in identifying subjects genetically at risk For example in hypertension only in less than 10% of the patients the genetic defect has been identified It has been known for quite some time that in heart and blood vessels fetal genes are as high blood pressure and upregulated or induced when they are exposed to such disorders ischemia Little is known about the function of these genes in the cardiac and vascular adaptation to these disorders only guesses can be made *Generation and Characterization of a Mouse Model for a Sodium Channel Based Long QT Syndrome (LQT3)* Dieter Nuyens, 2006 **Cardiac Repolarization** Ihor Gussak, Charles Antzelevitch, Stephen C. Hammill, Win K.
