Clinical MR Imaging and Physics Haris S. Chrysikopoulos, 2008-11-01
Keywords Spin Electromagnetic radiation Resonance Nucleus Hydrogen Proton Certain atomic nuclei possess inherent magnetic Let us summarize the MRI procedure The patient properties called spin and can interact with electro is placed in a magnetic field and becomes temporarily 1 magnetic EM radiation through a process called magnetized Resonance is achieved through the resonance When such nuclei absorb EM energy they plication of specific pulses of EM radiation which is proceed to an excited unstable configuration Upon absorbed by the patient Subsequently the excess return to equilibrium the excess energy is released ergy is liberated and measured The captured signal producing the MR signal These processes are not is processed by a computer and converted to a gray random but obey predefined rules scale MR image The simplest nucleus is that of hydrogen H con Why do we need to place the patient in a m sisting of only one particle a proton Because of its net Because the earth s magnetic field is too weak to abundance in humans and its strong MR signal H be clinically useful it varies from 0.3 to 0.7 Gauss G is the most useful nucleus for clinical MRI Thus for current clinical MR systems operate at low mid or our purposes MRI refers to MRI of hydrogen and for high field strength ranging from 0.1 to 3
