Study on Microstructure and Rheological Properties of Cement-Chemical Admixtures-Water Dispersion System at Early Stage Yanrong Zhang, 2017-07-25 This thesis studies the effects of superplasticizers, polyacrylate latexes and asphalt emulsions which differ in molecular particle size from nanometers to microns on the rheological properties of fresh cement pastes (FCPs) as well as the action mechanisms involved. It systematically investigates the rheological properties and microstructure of cement based materials and elucidates the adsorption behaviors of polycarboxylate polymers with different functional groups and their effects on cement hydration. Moreover, it reveals how the working mechanism of naphthalene sulfonate formaldehyde (NSF) differs from that of polycarboxylate ether based PCE superplasticizers. Lastly, it develops a conceptual microstructure model and two rheological equations. These findings lend theoretical support to the

Scientific Methods and Cultural Heritage Gilberto Artioli,2010-07-08 Scientific techniques developed in materials science offer invaluable information to archaeology art history and conservation A rapidly growing number of innovative methods as

well as many established techniques are constantly being improved and optimised for the analysis of cultural heritage materials. The result is that on the one hand more complex problems and questions can be confronted but on the other hand the required level of technical competence is widening the existing cultural gap between scientists and end users such as archaeologists, museum curators, art historians and many managers of cultural heritage who have a purely humanistic background. The book is intended as an entry level introduction to the methods and rationales of scientific investigation of cultural heritage materials with emphasis placed on the analytical strategies, modes of operation and resulting information rather than on technicalities. The extensive and updated reference list should be a useful starting point for further reading. Students and researchers from the humanities approaching scientific investigations should find it useful as well as scientists applying familiar techniques and methods to unfamiliar problems related to cultural heritage.

Active Rheology Control of Cementitious Materials Geert De Schutter, Karel Lesage, 2023-01-18 This book reports on cutting edge research within the new field of active rheology control of cementitious materials presenting new ideas developed within the ERC Advanced Grant Project SmartCast hosted at Ghent University which extend the possibilities of admixtures and additions beyond current options. The research presented here develops a new method of actively controlling the rheology of fresh concrete during casting operations by incorporating specially designed responsive components. This results in real time changes to the rheological behaviour of the cementitious material allowing the user to intervene actively after the cementitious material has left the mixing phase. This newly gained agility contributes to increased processing speed and placement reliability in the case of traditional casting methods and can also facilitate advanced 3D concrete printing. The different routes followed to achieve this Active Rheology Control are explained within. The book suits researchers and innovative practitioners and is the first comprehensive text to present these new findings. Textile Reinforced Concrete Alva Peled, Arnon Bentur, Barzin Mobasher, 2017-08-07 Textile reinforced concrete TRC has emerged in recent years as an attractive new high performance cement based composite. Textiles can significantly improve the mechanical behavior of cement matrices under static and dynamic conditions and give superior tensile strength, toughness, ductility, energy absorption and protection against environmental degrading influences. Flexibility with fabric production methods enables the control of fabric and yarn geometry. This along with the ability to incorporate into the fabric a range of yarns of different types and performances as well as cement matrix modifications enables design of the composite to a wide range of needs. The book is intended to provide a comprehensive treatment of TRC covering the basic fundamentals of the composite material itself and the principles governing its performance on a macro scale as a component in a structure. It provides in depth treatment of the fabric methods for production of the composite, the micro mechanics with special attention to the role of bonding and microstructure behavior under static and dynamic loading, sustainability design and the

applications of TRC composites
