

Development of basic techniques for producing fully human monoclonal antibodies

This shows the process of producing cancer antigen-specific fully human monoclonal antibodies from B cells immortalized with cancer patient-derived EB virus.

B cells with the specific antibody can be selected and captured at the single cell level (single cell sorting) with GST labeled cancer antigen protein and PE labeled anti-human IgG antibody stain, and the antibody sequence can be identified by direct gene cloning.

Marks, 2015-06-28 This book is the first to tell the extraordinary yet unheralded history of monoclonal antibodies Often referred to as Mabs they are unfamiliar to most nonscientists yet these microscopic protein molecules are everywhere quietly shaping our lives and healthcare Discovered in the mid 1970s in the laboratory where Watson and Crick had earlier unveiled the structure of DNA Mabs have radically changed understandings of the pathways of disease They have enabled faster cheaper and more accurate clinical diagnostic testing on a vast scale And they have played a fundamental role in pharmaceutical innovation leading to such developments as recombinant interferon and insulin and personalized drug therapies such as Herceptin Today Mabs constitute six of the world s top ten blockbuster drugs and make up a third of new introduced treatments Lara V Marks recounts the risks and opposition that a daring handful of individuals faced while discovering and developing Mabs and she addresses the related scientific medical technological business and social challenges that arose She offers a saga of entrepreneurs whose persistence and creativity ultimately changed the healthcare landscape and brought untold relief to millions of patients Even so as Marks shows controversies over Mabs remain and she examines current debates over the costs and effectiveness of these innovative drugs *Webb's Physics of Medical Imaging* M Flower, 2016-02-03 Since the publication of the best selling

Diagnostic and Therapeutic Antibodies Andrew J.T. George, Catherine E. Urch, 2008-02-02 Soon after the first description of monoclonal antibodies in 1976 there was enormous interest in the clinical application of antibodies especially in the context of cancer Antibodies appeared to offer the magic bullet that would allow the specific destruction of neoplastic cells However many years effort resulted in very few cases of successful immunotherapy with antibodies As a result there was a major backlash against antibody therapy and the field lost a considerable amount of popularity Fashion in science as well as in other things tends to be cyclical Antibody based therapy is once again attracting scientists and clinicians There are several reasons for the renewed optimism certainly the experience of the last two decades has provided a wealth of information about problems associated with antibody therapy and possible solutions to these problems Recombinant antibody engineering has rejuvenated the field allowing both the modification of antibodies to improve their in vivo properties and the isolation of novel antibody molecules by such techniques as phage display The results of recent clinical trials have demonstrated unequivocally the benefit of antibody therapy in a number of settings and finally more careful consideration has been taken of the types of disease best treated using this approach

Biological Electron Microscopy Michael J. Dykstra, Laura E.

Reuss, 2011-06-28 Electron microscopy is frequently portrayed as a discipline that stands alone separated from molecular biology light microscopy physiology and biochemistry among other disciplines It is also presented as a technically demanding discipline operating largely in the sphere of black boxes and governed by many absolute laws of procedure At the introductory level this portrayal does the discipline and the student a disservice The instrumentation we use is complex but ultimately understandable and more importantly repairable The procedures we employ for preparing tissues and cells are not totally understood but enough information is available to allow investigators to make reasonable choices concerning the best techniques to apply to their particular problems There are countless specialized techniques in the field of electron and light microscopy that require the acquisition of specialized knowledge particularly for interpretation of results electron tomography and energy dispersive spectroscopy immediately come to mind but most laboratories possessing the equipment to effect these approaches have specialists to help the casual user The advent of computer operated electron microscopes has also broadened access to these instruments allowing users with little technical knowledge about electron microscope

design to quickly become operators This has been a welcome advance because earlier instruments required a level of knowledge about electron optics and vacuum systems to produce optimal photographs and to avoid crashing the instruments that typically made it difficult for beginners
