Associated with Exposure to Chemicals P. Foster,World Health Organization,International Program on Chemical Safety,2001 Intended as a tool for use by public health officials research and regulatory scientists and risk managers this publication seeks to provide a scientific framework for the use and interpretation of reproductive toxicity data from human and animal studies It also discusses emerging methodology and testing strategy in reproductive toxicity The text focuses on approaches to assessing reproductive toxicity in males and females including sexual dysfunction and infertility and many aspects of developmental toxicity following both prenatal and postnatal exposure from conception to sexual maturation It is

an overview of the major scientific principles underlying hazard identification testing methods and risk assessment strategies in human reproductive toxicity. It also discusses the evaluation of reproductive toxicity data in the context of the extensive risk assessment methodology that has emerged over the past 10-15 years.

Principles and Methods for the Assessment of Risk from Essential Trace Elements

Inter-Organization Programme for the Sound Management of Chemicals, International Program on Chemical Safety, 2002-02. The risk assessment approach described in this monograph applies only to essential trace elements (ETEs) involved in human health and not to non-essential elements. The purpose of this monograph is to provide the scientific principles that support the concept of an acceptable range of oral intake (ARO) which uses a homeostatic model for determining the range of dietary intakes for essential trace elements (ETEs) that meet the nutritional requirements of a healthy population and avoid excess intakes. To facilitate comparisons, AROs are discussed in relation to other risk assessment approaches. Although it includes examples, this monograph is not a compendium of assessments on ETEs nor is it a textbook detailing the scientific basis of risk assessment or the derivation of dietary reference intakes. Described in the book is the process of risk assessment which begins with the selection of the database for a particular ETE. A weight of evidence approach is then used for hazard identification, selecting relevant end point of deficient and excess exposures. Next, the probability of risk and the severity of various effects are quantified and critical effects are selected. The ARO is then established by balancing end points of comparable health significance. At this time, the exposure assessment is conducted. Finally, a risk characterization enumerating the strengths and weaknesses of the databases is performed, integrating the ARO and exposure assessment. The amount of work which is entailed in these volumes is very great and the low cost does not reflect the time of experts travelling nor even the hours expended. UN staff in Geneva. This well-informed book with its predecessors in the series is essential reading for biologists, chemists and medical professionals concerned with essential trace elements. *The International Journal of Environmental Studies* *Developments in Aging*
