Proceedings of the International Symposium on Seed Enhancement and Seedling Production Technology Changhoo Chun,Daniel Ivan Leskovar,2008

Applying population-based threshold models to quantify and improve seed quality attributes Prof Kent J. Bradford,Dr Pedro Bello,2022-07-25 Achieving rapid and uniform stand establishment in crops requires a combination of high quality seeds and appropriate environmental conditions In particular temperature and soil moisture or water potential are the major factors influencing germination in the field In this chapter we focus on the application of population based threshold PBT models to characterize seed germination time courses and how environmental and technological inputs influence them Viewing seed quality as a product of the behavior of populations of individual seeds is critical for understanding the causes and consequences of poor performance Quantitatively characterizing seed population features enables their use in seed sorting and seed enhancement and provides phenotypes for use in research breeding conservation and restoration We believe that PBT models are essential tools to enable full utilization of new advances in seed technology to improve seed quality and enable successful stand establishment in agriculture or in natural settings

The Nanotechnology Driven Agriculture Swarnendu Roy,Akbar Hossain,2024-03-29 Nanotechnology is believed to accelerate our fight to sustain and enhance crop productivity for the ever increasing world population It has been reckoned as one of the safest and most cost efficient techniques to boost crop productivity in the future The ever increasing state of the art availability of various nanomaterials has allowed us to pursue their beneficial properties in agronomy Nanotechnology will help minimize the

dependency on chemical fertilizers and existing crop production techniques that have already been exploited to their maximum potential. Therefore, in the present context, it could well be realized that agriculture will be driven by nanotechnology in the future. This book focuses on the application of nanotechnology for enhancing crop production through the application of nanofertilizers or nanocomposites. Several avenues of nanotechnology are beneficial in improving crop productivity in a sustainable manner, which has been presented in a comprehensive way. The book also delves into the mechanistic view of nanoparticle functioning and its role in stress alleviation. In addition, the book presents some recent insights into the application of nanotechnology for post-harvest management, stress tolerance, and usage as nanobiosensors. Broadly, the book will encompass the following advances in the field, distinguishing it from other published volumes. The salient features include: Role of nanoparticles in improving abiotic stress tolerance in plants; Role of nanoparticles in protection against pathogens and pests; Mechanism of nanoparticle-induced plant responses; Synthesis and modification of nanoparticles to enhance their biological efficacy; Prospects of nanofertilizers, nanoformulations, nanopesticides, etc., and their beneficial attributes. This book therefore presents this emerging topic and the most recent innovations in this field for postgraduate students, researchers, and faculty members working in the fields of plant science, microbiology, biotechnology, agricultural sciences, etc.
