## **Seismic Tomography With Applications In Global Seismology And Exploration Geophysics:**

Seismic Tomography Guust Nolet, 1987-06-30 Methods to construct images of an object from projections of x rays ultrasound or electromagnetic waves have found wide applications in electron microscopy diagnostic medicine and radio astronomy Projections are measurable quantities that are a function usually involving a line integral of physical properties of an object Convolutional methods or iterative algorithms to solve large systems of linear equations are used to reconstruct the object In principle there is no reason why similar image reconstructions can not be made with seismic waves In practice seismic tomography meets with a number of difficulties and it is not until the last decade that imaging of transmitted seismic waves has found application in the Earth sciences The most important difference between global seismic tomography and more conventional applications in the laboratory is the fact that the seismologist is confronted with the lack of anything resembling a well controlled experimental set up Apart from a few nuclear tests it is not in our power to locate or time seismic events Apart from a few seabottom seismographs our sensors are located on land and even there the availability of data depends on cultural and political factors Even in exploration seismics practical factors such as the cost of an experiment put strong limitations on the completeness of the data set
