Zanella,2012-12-06 General surgery consists of a main corpus of propaedeutic elements and clinical problems which has been modified over the years by the separate development of numerous sub specialistic branches Although a common basis on the physiopathology of surgical trauma and post operative complications persists as a result of general knowledge of surgical diseases there is no doubt that in the spheres of doctrine and application both research and clinical medicine have distinguished themselves autonomously in many surgical fields orthopedics neurosurgery cardiovascular surgery thoracic surgery urology etc It is therefore difficult to define the present configuration of general surgery but without question abdominal surgery occupies a position of pre eminent importance within the general framework We are dealing in fact with pathological pictures which occur in a section of the body of vast proportions in which structures organs and morphologically complex spaces are arranged to carry out important functions They are therefore subject to considerably complex pathological alterations such as to establish an interesting field of diagnostic discussion and an exciting training ground for surgical activity It can be affirmed that the diagnosis and cures of abdominal surgical diseases constitute a test of the surgeon's experience Diagnosis is often entrusted to a differential process the results of which may be confirmed today by complementary diagnostics This however must be guided by predominating clinical considerations the exaggerated use of diagnostic techniques detached from clinical examination being the cause of very serious errors which can mislead decision making and human contact which is the basis of correct medical practice **Schuster Atlas of Gastrointestinal Motility in Health and Disease** Marvin Meier Schuster, Michael D.
