## **Selected Chapters In The Calculus Of Variations Lecture Notes By Oliver Knill:**

**Selected Chapters in the Calculus of Variations** Jürgen Moser, 2012-12-06 0 1 Introduction These lecture notes describe a new development in the calculus of variations which is called Aubry Mather Theory The starting point for the theoretical physicist Aubry was a model for the description of the motion of electrons in a two dimensional crystal Aubry investigated a related discrete variational problem and the corresponding minimal solutions On the other hand Mather started with a specific class of area preserving annulus mappings the so called monotone twist maps These maps appear in mechanics as Poincare maps Such maps were studied by Birkhoff during the 1920s in several papers In 1982 Mather succeeded to make essential progress in this field and to prove the existence of a class of closed invariant subsets which are now called Mather sets His existence theorem is based again on a variational principle Although these two investigations have different motivations they are closely related and have the same mathematical foundation We will not follow those approaches but will make a connection to classical results of Jacobi Legendre Weierstrass and others from the 19th century Therefore in Chapter I we will put together the results of the classical theory which are the most important for us The notion of extremal fields will be most relevant In Chapter II we will investigate variational problems on the 2 dimensional torus We will look at the corresponding global minimals as well as at the relation between minimals and extremal fields In this way we will be led to Mather sets

**Handbook of Mathematics for Engineers and Scientists** Andrei D. Polyanin, Alexander V. Manzhirov, 2006-11-27 Covering the main fields of mathematics this handbook focuses on the methods used for obtaining solutions of various classes of mathematical equations that underlie the mathematical modeling of numerous phenomena and processes in science and technology The authors describe formulas methods equations and solutions that are frequently used in scientific and engineering applications and present classical as well as newer solution methods for various mathematical equations The book supplies numerous examples graphs figures and diagrams and contains many results in tabular form including finite sums and series and exact solutions of differential integral and functional equations

**Memoirs of the Scientific Sections of the Academy of the Socialist Republic of Romania**, 2003 *A Study of Heteroclinic Orbits for a Class of Fourth Order Ordinary Differential Equations* Denis Bonheure, 2004 In qualitative theory of differential equations an important role is played by special classes of solutions like periodic solutions or solutions to some boundary value problems When a system of ordinary differential equations has equilibria i.e. constant solutions whose stability properties are known it is significant to search for connections between them by trajectories of solutions of the given system These are called homoclinic or heteroclinic according to whether they describe a loop based at one single equilibrium or they start and end at two distinct equilibria This thesis is devoted to the study of heteroclinic solutions for a specific class of ordinary differential equations related to the Extended Fisher Kolmogorov equation and the Swift Hohenberg equation These are semilinear fourth order bistable evolution equations which appear as mathematical models for problems arising in Mechanics

Chemistry and Biology For such equations the set of bounded stationary solutions is of great interest These solve an autonomous fourth order equation In this thesis we focus on such equations having a variational structure In that case the solutions are critical points of an associated action functional defined in convenient functional spaces We then look for heteroclinic solutions as minimizers of the action functional Our main contributions concern existence and multiplicity results of such global and local minimizers in the case where the functional is defined from sign changing Lagrangians The underlying idea is to impose conditions which imply a lower bound on the action over all admissible functions We then combine classical arguments of the Calculus of Variations with careful estimates on minimizing sequences to prove the existence of a minimum
