Principles Of Process Planning A Logical Approach:

Principles of Process Planning G. Halevi, R. Weill, 1994-12-31 Process planning determines how a product is to be manufactured and is therefore a key element in the manufacturing process. It plays a major part in determining the cost of components and affects all factory activities: company competitiveness, production planning, production efficiency, and product quality. It is a crucial link between design and manufacturing. There are several levels of process planning activities. Early in product engineering and development, process planning is responsible for determining the general method of production. The selected general method of production affects the design constraints. In the last stages of design, the designer has to consider ease of manufacturing in order for it to be economic. The part design data is transferred from engineering to manufacturing and process planners develop the detailed work package for manufacturing a part. Dimensions and tolerances are determined for each stage of processing of the workpiece. Process planning determines the sequence of operations and utilization of machine tools. Cutting tools, fixtures, gauges, and other accessory tooling are also specified. Feeds, speeds, and other parameters of the metal cutting and forming processes are determined.

Process and Operation Planning G. Halevi, 2003-11-30 Process planning determines how a product is to be manufactured and is therefore a key element in the manufacturing process. It plays a major part in determining the cost of components and affects all factory activities: company competitiveness, production planning, production efficiency, and product quality. It is a crucial link between design and manufacturing. In spite of the importance of process planning in the manufacturing cycle, there is no formal methodology which can be used or can help to train personnel for this job. Process planning activities are predominantly labor intensive, depending on the experience and the skill and intuition of the planner, and therefore often precludes a thorough analysis and optimization of the process plan, which nearly always results in higher than necessary production costs, delays, errors, and non-standardization of processes. Process planning

is regarded as an art and not a science Research in the field of process planning has indicated that all experts have their own expertise and one expert's experience might be different from that of another It is rare therefore for two planners to produce the same process Each process will produce the part as specified although different processes will result in different processing times and costs The question is who is an expert By definition an expert is one having or manifesting the knowledge skill and experience needed for success in a particular field or endeavor or one who has acquired special skill in or knowledge and mastery of something

Expectations and Disappointments of Industrial Innovations Gideon Halevi, 2017-04-25 The Integrated Manufacturing System IMS Group Technology Numerical Control and Computer Aided Design CAD were four outstanding innovations that were one time milestones of scientific industrial management This book describes the expectations and disappointments of the common pitfalls of these ingenious ideas which leads to understanding of their gradual disappearing and proposes a way to restore these methods for long term utility and value The first three innovations dominated the industry till the mid 1970s Surprisingly the reason for them being replaced is the same research of the routine was misleading regardless of its ingenuity In the fourth case CAD does not support CAPP Computer Aided Process Planning and thus Numerical Control could no longer support developments of a system such as a flexible and automated factory However they incorporate many features in a specific resource instead within a manufacturing system CAD technology and machining centers remain remarkable as a specific unique manufacturing resource This work proposes ways to revive these innovations for the future Innovation is a driver for the development of new products and production methods It should be an integral part of a system and not pursued for its own sake This volume shows explains and remedies this by treating these interesting examples

In the latter half of the 20th century forces have conspired to make the human community at last global The easing of tensions between major nations the expansion of trade to worldwide markets widespread travel and cultural exchange pervasive high speed communications and automation the explosion of knowledge the streamlining of business and the adoption of flexible methods have changed the face of manufacturing itself and of research and education in manufacturing The acceptance of the continuous improvement process as a means for organizations to respond quickly and effectively to swings in the global market has led to the demand for individuals educated in a broad range of cultural organizational and technical fields and capable of absorbing and adapting required knowledge and training throughout their careers No longer will manufacturing research and education focus on an industrial sector or follow a national trend but rather will aim at enabling international teams of companies to cooperate in rapidly designing prototyping and manufacturing products The successful enterprise of the 21st century will be characterized by an organizational structure that efficiently responds to customer demands and changing global circumstances a corporate culture that empowers employees at all levels and encourages constant communication among related groups and a technological infrastructure that fully supports process improvement and integration In changing itself to keep abreast of the broader transformation in manufacturing the enterprise must look first at its organization and culture and thereafter at supporting technologies Proceedings Of 17th All India Manufacturing Technology , **Smart Product Engineering** Michael Abramovici,Rainer Stark,2013-03-14 The

collection of papers in this book comprises the proceedings of the 23rd CIRP Design Conference held between March 11th and March 13th 2013 at the Ruhr University Bochum in Germany. The event was organized in cooperation with the German Academic Society for Product Development WiGeP. The focus of the conference was on Smart Product Engineering covering two major aspects of modern product creation: the development of intelligent smart products as well as the new smart approach of engineering explicitly taking into account consistent systems integration. Throughout the 97 papers contained in these proceedings, a range of topics are covered amongst them the different facets and aspects of what makes a product or an engineering solution smart. In addition, the conference papers investigate new ways of engineering for production planning and collaboration towards Smart Product Engineering. The publications provide a solid insight into the pressing issues of modern digital product creation facing increasing challenges in a rapidly changing industrial environment. They also give implicit advice how a smart product or engineering solution processes methods and tools need to be designed and implemented in order to become successful.

Computer-Aided Design, Engineering, and Manufacturing Cornelius T. Leondes, 2000-12-12 In the competitive business arena, companies must continually strive to create new and better products faster, more efficiently, and more cost effectively than their competitors to gain and keep the competitive advantage. Computer-aided design (CAD), computer-aided engineering (CAE), and computer-aided manufacturing (CAM) are now the industry standards.

Handbook of Production Management Methods Gideon Halevi, 2001-10-22 This unique book provides a guide to the selection of appropriate production and manufacturing methods for postgraduate and professional manufacturing engineers. It starts by helping the reader to identify the required objectives of industrial management for their particular situation. Having identified the objectives, an analytical assessment of the available production and management methods is made. The analytical system presents an objective method of production selection. For example, this practical book will help the reader to decide whether or not a local Just in Time process is needed or a full chain JIT method is needed. Alternatively, the problem may be deciding between set up time reduction or changeover time reduction. Should TQM be ceded to PCIs? This book covers nearly all methods of production and manufacturing and will prove the most comprehensive guide to choosing and using these methods. Only book of its kind available. Widest coverage of methods available. Analytical approach to decision making.

Restructuring the Manufacturing Process Applying the Matrix Method Gideon Halevi, 1998-12-21 Consider the possibility of a manufacturing method that can do all this: reduce lead time, increase product diversity, produce higher quality products, allow more competitive pricing, ensure customer satisfaction, reach dominance in the global marketplace. Those are all part of the upside potential for the Matrix Manufacturing Method. Its promising premise: apply beneficial technology to all stages of the manufacturing process, leading to increased efficiency. Actually, the Matrix Manufacturing Method is far more than a mere promise; it's already become standard and successful practice at many companies. Details of the Matrix Manufacturing

Method now make their first ever appearance in Restructuring the Manufacturing Process Applying the Matrix Method describing this important new philosophy of manufacturing management and practical ways to bring its concepts into reality A pioneer of the Matrix Manufacturing Method Halevi presents comprehensive and convincing details behind its rationale and practice The method s foundation incorporate engineering stages technology during production management stages allowing qualified professionals to make crucial decisions at execution time through the use of accurate and flexible engineering data As the book s case histories demonstrate companies that have taken those measures now benefit from a new degree of freedom in the manufacturing cycle and its myriad advantages Numerous theories may have been proposed to create technology driven manufacturing processes what makes the Matrix Manufacturing Theory most valuable is its improvements of all disciplines aspects and activities related to product production Gain that all inclusive competitive edge with Restructuring the Manufacturing Process Applying the Matrix Method
