humanity's millennia long quest for self knowledge the sciences of the mind are now in a position to offer concrete  
empirically validated answers to the most fundamental questions about human nature What does it mean to be a mind How is  
the mind related to the brain How are minds shaped by their embodiment and environment What are the principles behind  
cognitive functions such as perception memory language thought and consciousness By analyzing the tasks facing any  
sentient being that is subject to stimulation and a pressure to act Shimon Edelman identifies computation as the common  
denominator in the emerging answers to all these questions Any system composed of elements that exchange signals with  
each other and occasionally with the rest of the world can be said to be engaged in computation A brain composed of neurons  
is one example of a system that computes and the computations that the neurons collectively carry out constitute the brain's  
mind Edelman presents a computational account of the entire spectrum of cognitive phenomena that constitutes the mind He  
begins with sentience and uses examples from visual perception to demonstrate that it must at its very core be a type of  
computation Throughout his account Edelman acknowledges the human mind's biological origins Along the way he also  
demystifies traits such as creativity language and individual and collective consciousness and hints at how naturally evolved  
minds can transcend some of their limitations by moving to computational substrates other than brains The account that  
Edelman gives in this book is accessible yet unified and rigorous and the big picture he presents is supported by evidence  
ranging from neurobiology to computer science The book should be read by anyone seeking a comprehensive and current  
introduction to cognitive psychology     **Medical Books and Serials in Print** ,1983     Deep Listeners Judith
