PORTFOLIO PERFORMANCE EVALUATION

Portfolio evaluation is the last step in the process of portfolio management. Portfolio evaluation is the stage where we examine to what extent the objective has been achieved. Through portfolio evaluation the investor tries to find out how well the portfolio has performed. The portfolio of securities held by an investor is the result of his investment decision. Portfolio evaluation is really a study of the impact of such decisions. Without portfolio evaluation portfolio management would be incomplete.

Meaning:

Portfolio evaluation refers to the evaluation of the performance of the portfolio. It is essentially the process of comparing the return earned on a portfolio with the return earned on one or more other portfolios or on a benchmark portfolio.

Portfolio evaluation comprises two functions: performance measurement and performance evaluation.

Performance measurement is an accounting function which measures the return earned on a portfolio during the holding period or investment period.

Performance evaluation addresses such issues as whether the performance was superior or inferior, whether the performance was due to skill or luck, etc.

While evaluating the performance of a portfolio the return earned on the portfolio has to be evaluated in the context of the risk associated with that portfolio. One approach would be to group portfolios into equivalent risk classes and then compare returns of portfolios within each risk category. An alternative approach would be to specifically adjust the return for the riskiness of the portfolio by developing risk adjusted return measure and use these for evaluating portfolios across differing risk levels.

Need for evaluation:

Evaluation is an appraisal of performance. Whether the investment activity is carried out by individual investors themselves or through mutual funds and investment companies, different situations arise where evaluation of performance becomes imperative. These situations are discussed below:

1. **Self evaluation:** where individual investors undertake the investment activity on their own, the investment decisions are taken by them. They construct and manage their own portfolio of securities. In such a situation, an investor would like to evaluate the performance of his portfolio in order to identify the mistakes committed by him. This self evaluation will enable him to improve his skills and achieve better performance in future.
2. **Evaluation of portfolio managers:** a mutual fund or investment company usually creates different portfolios with different objectives aimed at different sets of investors. Each such portfolio may be entrusted to different professional portfolio managers who are responsible for the investment decisions regarding the portfolio entrusted to each of them. In such a situation, the organization would like to evaluate the performance of each portfolio so as to compare the performance of different managers.
3. **Evaluation of mutual funds:** investors and organizations desirous of placing their funds with mutual funds would like to know the comparative performance of each so as to select the best mutual fund or investment company. For this, evaluation of the performance of mutual funds and their portfolios becomes necessary.

Evaluation perspective:

Evaluation may be carried from different perspective or viewpoints such as—

1. **Transaction view:** an investor may attempt to evaluate every transaction of purchase and sale of securities. Whenever, a security is bought and sold, the transaction is evaluated as regards its correctness

in different kinds of uncertainty and present the ways for striking a balance between investment return and risk such that an optimal portfolio can be obtained. In classical portfolio theory security returns were assumed to be random variables and probability theory was the main mathematical tool for handling uncertainty in the past. However the world is complex and uncertainty is varied. Randomness is not the only type of uncertainty in reality especially when human factors are included. Security market one of the most complex markets in the world contains almost all kinds of uncertainty. These security returns are sensitive to various factors including economic, social, political and very importantly people's psychological factors. Therefore other than strict probability method scholars have proposed some other approaches including imprecise probability, possibility and interval set methods etc to deal with uncertainty in portfolio selections since 1990's. In this book we want to add to the tools existing in sciences some new and unorthodox approaches for analyzing uncertainty of portfolio returns. When security returns are fuzzy we use credibility which has self duality property as the basic measure and employ credibility theory to help make selection decisions such that the decision result will be consistent with the laws of contradiction and excluded middle. Being aware that one tool is not enough for solving complex practical problems we further employ uncertain measure and uncertainty theory to help select an optimal portfolio when security returns behave neither randomly nor fuzzily. One core of portfolio selection is to find a quantitative risk definition of a portfolio investment.
