Lives of Weeds John Cardina, 2021-09-15 *Lives of Weeds* explores the tangled history of weeds and their relationship to humans Through eight interwoven stories John Cardina offers a fresh perspective on how these tenacious plants came about why they are both inevitable and essential and how their ecological success is ensured by determined efforts to eradicate them Linking botany history ecology and evolutionary biology to the social dimensions of humanity's ancient struggle with feral flora Cardina shows how weeds have shaped and are shaped by the way we live in the natural world Weeds and attempts to control them drove nomads toward settled communities encouraged social stratification caused environmental disruptions and have motivated the development of GMO crops They have snared us in social inequality and economic instability infested social norms of suburbia caused rage in the American heartland and played a part in perpetuating pesticide use worldwide *Lives of Weeds* reveals how the technologies directed against weeds underlie ethical questions about agriculture and the environment and leaves readers with a deeper understanding of how the weeds around us are entangled in our daily choices

Advances in Seed Priming Amitava Rakshit, Harikesh Bahadur Singh, 2018-06-07 Most crop plants grow in environments that are suboptimal which prevents the plants from attaining their full genetic potential for growth and reproduction Stress due to abiotic and biotic agents has a significant effect on world food production Annually an estimated 15% of global yields are lost but this figure belies far greater losses for specific food systems and the people whose existence is dependent upon them particularly in developing countries Current efforts to mitigate these losses are worryingly over reliant on the use of sophisticated and costly chemicals measures with substantial economic and environmental costs or on the development of efficient and smart crop varieties which can take decades What we need is a broad range of safe robust and equitable solutions for food producers One under investigated approach is that of utilizing the crop plant's innate immune system to resist stress More specifically the innate immune system can be sensitized or primed to respond more quickly and strongly to protect the plant against stresses

However a strategy of employing priming in combination with reduced pesticide use can enhance protection and help to meet commitments to reducing chemical inputs in agriculture This book discusses in detail different segments of priming in addressing stress factors and traits to increase competitiveness against all odds Adopting a holistic and systematic approach it addresses priming to counter climate change related adverse effects coupled with pest and pathogen related stress on the productivity of crops utilizing natural resources to reap sustainable environmental economic and social benefits for potential productivity of crops maintaining synergy between soil water and plants in ways that mimic nature **Plant Desiccation**

Seed Dormancy, Germination and Pre-Harvest Sprouting Chengdao Li,Hiro Nonogaki,Jose Barrero,2019-03-28 Pre harvest sprouting PHS and late maturity alpha amylase LMA are two of the biggest grain quality defects that grain growers encounter About 50 percent of the global wheat crop is affected by pre harvest sprouting to various degrees Pre harvest sprouting is a genetically based quality defect and results in the presence of alpha amylase in otherwise sound mature grain It can range from perhaps undetectable to severe damage on grain and is measured by the falling numbers or alpha amylase activity This is an international issue with sprouting damage

lowering the value of crops to growers seed and grain merchants millers maltsters bakers other processors and ultimately the consumer As such it has attracted attention from researchers in many biological and non biological disciplines The 13th International Symposium on Pre Harvest Sprouting in Cereals was held 18-20 September 2016 in Perth to discuss current findings of grain physiology genetic pathways trait expression and screening methods related to pre harvest sprouting and LMA This event followed the previous symposium in 2012 in Canada

Climate Change and Global Crop Productivity K. R. Reddy, H. F. Hodges, 2000-04-25 Annotation Worldwide climatic changes have been raising concerns about potential changes to crop yields and production systems Such concerns include the ability to accommodate these uncertain effects in order to ensure an adequate food supply for an increasing population Written by leading international experts this book is the first comprehensive examination of the potential effects climate change particularly green house gases will have on agroecosystems It also reviews the effects such systems have on climate change itself

Annual Plant Reviews, Seed Development, Dormancy and Germination Kent Bradford, Hiro Nonogaki, 2008-04-15 The formation dispersal and germination of seeds are crucial stages in the life cycles of gymnosperm and angiosperm plants The unique properties of seeds particularly their tolerance to desiccation their mobility and their ability to schedule their germination to coincide with times when environmental conditions are favorable to their survival as seedlings have no doubt contributed significantly to the success of seed bearing plants Humans are also dependent upon seeds which constitute the majority of the world's staple foods e.g. cereals and legumes Seeds are an excellent system for studying fundamental developmental processes in plant biology as they develop from a single fertilized zygote into an embryo and endosperm in association with the surrounding maternal tissues As genetic and molecular approaches have become increasingly powerful tools for biological research seeds have become an attractive system in which to study a wide array of metabolic processes and regulatory systems

Seed Development Dormancy and Germination provides a comprehensive overview of seed biology from the point of view of the developmental and regulatory processes that are involved in the transition from a developing seed through dormancy and into germination and seedling growth It examines the complexity of the environmental physiological molecular and genetic interactions that occur through the life cycle of seeds along with the concepts and approaches used to analyze seed dormancy and germination behavior It also identifies the current challenges and remaining questions for future research The book is directed at plant developmental biologists geneticists plant breeders seed biologists and graduate students
