Risk In Business Decision:

A Study of Business Decisions Under Uncertainty Andreas Stark, 2010-07 This dissertation will discuss the uncertainty encountered in the daily operations of businesses The concepts will be developed by first giving an overview of probability and statistics as used in our everyday activities such as the basic principles of probability univariate and multivariate statistics data clustering and mapping as well as time sequence and spectral analysis The examples used will be from the oil and gas exploration industry because the risks taken in this industry are normally quite large and are ideal for showing the application of the various techniques for minimizing risk Subsequently the discussion will deal with basic risk analysis spatial and time variations of risk geotechnical risk analysis risk aversion and how it is affected by personal biases and how to use portfolios to hedge risk together with the application of real options Next fractal analysis and its application to economics and risk analysis will be examined followed by some examples showing the change in the Value at Risk under Fractal Brownian Motions Finally a neural network application is shown whereby some of these risks and risk factors will be combined to forecast the best possible outcome given a certain knowledge base The chapters will discuss Basic probability techniques and uncertainty principles Analysis and diversification for exploration projects The value and risk of information in the decision process Simulation techniques and modeling of uncertainty Project valuation and project risk return Modeling risk propensity or preference analysis of exploration projects Application of fractals to risk analysis Simultaneous prediction of strategic risk and decision attributes using multivariate statistics and neural networks Accounting & Business

Decisions , **Winning with Risk Management** Russell Walker, 2013 This book develops the notion that companies can succeed on the basis of risk management much as companies compete on efficiency costs labor location and other dimensions The reality of risk and how it impacts companies is that it is much more definite often catastrophic and looks more like a shock This is striking as a difference between firms on risk different than a marginal difference in operating efficiencies for example Competing on Risk Management requires a discipline a commitment to using information and recognizing shocks and then acting upon those to redistribute assets This book will examine how leading firms that compete on risk have done this and showcase best practices and impacts to the capital structure of firms and their organizational formation

Why Managers and Companies Take Risks Les Coleman, 2007-05-23 This book uses risk in its dictionary meaning as the probability of an undesirable outcome and has two research questions when managers make decisions what leads them to choose a risky alternative and what determines whether the decision proves correct Answers to these questions form a model of decision making that explains the process and results of managers risk taking in the real world There is an extensive literature on risk and decision making because the topic has been of interest in many disciplines since at least the 18th century Thus insights on the research questions are available from studies of animals humans and organisations and have been drawn by scholars in biology psychology finance and management Even so there is a large gap as most studies are conducted away from corporate settings and use subjects with limited decision experience The few studies set in real world conditions tend to concentrate on just a single aspect of decision makers attributes setting and behaviour and on either decision choices or outcomes The empirical work in this book is designed to fill part of this gap

The New Paradigm of Risk in Internal Transport Supporting Logistics 4.0 System Agnieszka Tubis, 2024-07-27 This book proposes a new approach to risk assessment in internal transport supporting material flows in the Logistics 4.0 system The development of Industry 4.0 and the accompanying digitization of processes in organizations cause changes related to the functioning of production and supporting systems As the research proves one of the areas of such change is the evolution of the risk occurring in logistics processes Despite the growing number of publications on risk assessment in Logistics 4.0 systems the research focuses solely on technical aspects related to the maintenance of cyber physical systems or organizational issues related to planning the operation of these systems However the currently developed Logistics 4.0 systems are complex cyber human technical system requiring an interdisciplinary approach to assessing the risk associated with their operation The literature research conducted by the author showed a clear research gap regarding risk assessment methods that consider the specific nature of internal logistics systems operating in the Industry 4.0 environment The purpose of the monograph is to present current risk assessment methods and indicate process and system changes related to implementing Industry 4.0 solutions in internal transport systems On this basis a risk assessment method that perceives internal transport as a complex human cyber physical system was proposed This method was developed based on a critical literature analysis which allowed to identify the current research gap and the author's research in enterprises implementing Industry 4.0 solutions Therefore the results presented in the book are the basis for developing the risk management concept offering a new body of knowledge regarding activated threats and the evolution of risk occurring in autonomous and

automatic internal transport systems The presented research results are also of utilitarian importance as they provide analytical tools and formulate conclusions constituting good practices for modern enterprises interested in digitizing and automating logistics processes

Enterprise Risk Management Stefan Hunziker, 2019-05-17 This textbook demonstrates how Enterprise Risk Management creates value in strategic and decision making processes The author introduces modern approaches to balancing risk and reward based on many examples of medium sized and large companies from different industries Since traditional risk management in practice is often an independent stand alone process with no impact on decision making processes it is unable to create value and ties up resources in the company unnecessarily Herewith he serves students as well as practitioners with modern approaches that promote a connection between ERM and corporate management The author demonstrates in a didactically appropriate manner how companies can use ERM in a concrete way to achieve better risk reward decisions under uncertainty Furthermore theoretical and psychological findings relevant to entrepreneurial decision making situations are incorporated This textbook has been recommended and developed for university courses in Germany Austria and Switzerland
