Vukobratovic, M. Kircanski, 2013-12-11 A few words about the series Scientific Fundamentals of Robotics should be said on the occasion of publication of the present monograph This six volume series has been conceived so as to allow the readers to master a contemporary approach to the construction and synthesis of control for manipulation robots The authors idea was to show how to use correct mathematical models of the dynamics of active spatial mechanisms for dynamic analysis of robotic systems optimal design of their mechanical parts based on the accepted criteria and imposed constraints optimal choice of

actuators synthesis of dynamic control algorithms and their microcomputer implementation In authors opinion this idea has been relatively successfully realized within the six volume mono graphic series Let us remind the readers of the books of this series Volumes 1 and 2 are devoted to the dynamics and control algorithms of manipulation robots respectively They form the first part of the series which has a certain topic related autonomy in the domain of the construction and application of the mathematical models of robotic mechanisms dynamics

Advances in Robot Kinematics and Computational Geometry

Jadran Lenarčič, Bahram Ravani, 2013-06-29 Recently research in robot kinematics has attracted researchers with different theoretical profiles and backgrounds such as mechanical and electrical engineering computer science and mathematics It includes topics and problems that are typical for this area and cannot easily be met elsewhere As a result a specialised scientific community has developed concentrating its interest in a broad class of problems in this area and representing a conglomeration of disciplines including mechanics theory of systems algebra and others Usually kinematics is referred to as the branch of mechanics which treats motion of a body without regard to the forces and moments that cause it In robotics kinematics studies the motion of robots for programming control and design purposes It deals with the spatial positions orientations velocities and accelerations of the robotic mechanisms and objects to be manipulated in a robot workspace The objective is to find the most effective mathematical forms for mapping between various types of coordinate systems methods to minimise the numerical complexity of algorithms for real time control schemes and to discover and visualise analytical tools for understanding and evaluation of motion properties of various mechanisms used in a robotic system
