Robustness in Automatic Speech Recognition Jean-Claude Junqua, Jean-Paul Haton, 2012-12-06 Foreword Looking back the past 30 years we have seen steady progress made in the area of speech science and technology I still remember the excitement in the late seventies when Texas Instruments came up with a toy named Speak and Spell which was based on a VLSI chip containing the state of the art linear prediction synthesizer This caused a speech technology fever among the electronics industry Particularly applications of automatic speech recognition were rigorously attempted by many companies some of which were start ups founded just for this purpose Unfortunately it did not take long before they realized that automatic speech recognition technology was not mature enough to satisfy the need of customers The fever gradually faded away In the meantime constant efforts have been made by many

researchers and engineers to improve the automatic speech recognition technology. Hardware capabilities have advanced impressively since that time. In the past few years we have been witnessing and experiencing the advent of the Information Revolution. What might be called the second surge of interest to commercialize speech technology as a natural interface for man-machine communication began in much better shape than the first one. With computers much more powerful and faster many applications look realistic this time. However there are still tremendous practical issues to be overcome in order for speech to be truly the most natural interface between humans and machines.

Survey of the State of the Art in Human Language Technology Giovanni Battista Varile, Antonio Zampolli, 1997. Originally published in 1997 this book is concerned with human language technology. This technology provides computers with the capability to handle spoken and written language. One major goal is to improve communication between humans and machines. If people can use their own language to access information working with software applications and controlling machinery the greatest obstacle for the acceptance of new information technology is overcome. Another important goal is to facilitate communication among people. Machines can help to translate texts or spoken input from one human language to the other. Programs that assist people in writing by checking orthography grammar and style are constantly improving. This book was sponsored by the Directorate General XIII of the European Union and the Information Science and Engineering Directorate of the National Science Foundation USA.

New Era for Robust Speech Recognition Shinji Watanabe, Marc Delcroix, Florian Metze, John R. Hershey, 2017-10-30. This book covers the state of the art in deep neural network based methods for noise robustness in distant speech recognition applications. It provides insights and detailed descriptions of some of the new concepts and key technologies in the field including novel architectures for speech enhancement microphone arrays robust features acoustic model adaptation training data augmentation and training criteria. The contributed chapters also include descriptions of real world applications benchmark tools and datasets widely used in the field. This book is intended for researchers and practitioners working in the field of speech processing and recognition who are interested in the latest deep learning techniques for noise robustness. It will also be of interest to graduate students in electrical engineering or computer science who will find it a useful guide to this field of research.

Resources for Second Language Pronunciation Learning and Teaching Shannon McCrocklin,2022-12-13 Second language L2 pronunciation has become increasingly visible as an important area of L2 teaching and research Despite the growing number of resources available focused on L2 pronunciation technology in L2 pronunciation has received much less attention While technology has been an enduring strand of L2 pronunciation research it has also been somewhat inconspicuous Indeed research has examined a wide variety of technologies such as language learning platforms speech visualization software and Automatic Speech Recognition Despite the abundance of research it can be difficult to gain a full sense of work in this area given the lack of a comprehensive and consolidated resource or reference This book endeavors to

fill that gap and make L2 pronunciation technologies more visible by providing teachers and researchers an introduction to research in a wide variety of technologies that can support pronunciation learning While working to introduce practitioners to numerous technologies available it also dives into the research basis for their use providing new studies and data featuring a wide variety of languages and learning contexts
