Scheiner, Jessica Gurevitch, 2001-04-26 Ecological research and the way that ecologists use statistics continues to change rapidly This second edition of the best selling Design and Analysis of Ecological Experiments leads these trends with an update of this now standard reference book with a discussion of the latest developments in experimental ecology and statistical practice The goal of this volume is to encourage the correct use of some of the more well known statistical techniques and to make some of the less well known but potentially very useful techniques available Chapters from the first edition have been substantially revised and new chapters have been added Readers are introduced to statistical techniques that may be unfamiliar to many ecologists including power analysis logistic regression randomization tests and empirical Bayesian analysis In addition a strong foundation is laid in more established statistical techniques in ecology including exploratory data analysis spatial statistics path analysis and meta analysis Each technique is presented in the context of resolving an ecological issue Anyone from graduate students to established research ecologists will find a great deal of new practical and useful information in this current edition      **Proceedings of the ... **Nitrogen Loading in Coastal Water Bodies** Richard A. Valigura, 2001-01-09 Published by the American Geophysical Union as part of the Coastal and Estuarine Studies Volume 57 Every time it rains biologically active nitrogen compounds are transferred from the air to whatever surface lies underneath what a farmer once called the poor man's fertilizer In fact nitrogen containing compounds are transferred between surface and atmosphere even when it is not raining That this atmospheric nitrogen deposition impacts on the environment is a scientifically accepted fact established during the acid rain debates led by the National Acid Precipitation Assessment Program The extent to which this deposition contributes to the decline of coastal waters around the United States due to over fertilization however is still under debate In response to and as a continuation of this debate is the current work before you the first attempt to consistently and comprehensively estimate the relative contribution of atmospherically delivered nitrogen to the total amount of nitrogen entering coastal estuaries around the United States

**Food Web Management** James F. Kitchell, 2012-12-06 This series is dedicated to serving the growing community of scholars and practitioners concerned with the principles and applications of environmental management Each volume is a thorough treatment of a specific topic of importance for proper management practices A fundamental objective of these books is to help the reader discern and implement man's stewardship of our environment and the world's renewable resources For we must strive to understand the relationship between man and nature act to bring harmony to it and nurture an environment that is both stable and productive These objectives have often eluded us because the pursuit of other individual and societal goals has diverted us from a course of living in balance with the environment At times therefore the environmental manager may have to exert restrictive control which is usually best applied to man not nature Attempts to alter or harness nature have often failed or backfired as exemplified by the results of imprudent use of herbicides fertilizers water and other agents Each book in this series will shed light on the fundamental and applied aspects of environmental management It is hoped that each will help solve a practical and serious environmental problem

**Proceedings of the Eleventh Biennial Southern Silvicultural Research Conference** Kenneth W. Outcalt, 2002

*Computational Econometrics* Charles G. Renfro, 2004 This publication contains a substantial amount of detail about the broad history of the development of econometric software based on the personal recollections of many people For economists the computer has increasingly become the primary applied research tool and it is software that makes the computer work

*Energy Demand in Industry* Nabaz T Khayyat, 2015-08-07 The book presents a stochastic analysis based on production risk and application of this method in the industrial sector under production risk where energy use is an input factor Using South Korea as a case study the book empirically models energy demand at the

industrial level and analyzes the results to identify key determinants of energy demand productions level productions risk and energy usage efficiency Particular attention is paid to the factors that enhance production risk or increase variations in energy input during production A dynamic panel model is specified and applied to 25 Korean industrial sectors over the period 1970 2007 The determinants of energy usage are identified and their effects in the form of elasticities of energy usage are estimated In addition the structural changes in the energy demand pattern are explored Stochastic production technology is applied to create two primary models A production model where the energy usage is a determinant of output and an energy demand model based on an inverted factor demand model where demand is a key determinant of the level of energy usage The findings reveal that First there are large variations in the degree of overuse or inefficiency in energy usage among the individual industries and over time second ICT information and communication technology capital and labor are substituting energy third ICT capital and value added services are two input factors decreasing the variability of energy demand while non ICT capital material and labor are increasing the variability of energy demand Finally the results suggest that technical progress contributes more to the increase of mean of energy demand than to the reduction of the level of risk An emerging recommendation is that industries increase the level of ICT capital and digitalization and invest more in R D activities and value added services to reduce the uncertainty related to their demand for energy This study forms the structure of the demand for energy under stochastic production risk for the South Korean industrial sector Public research programs aimed at the industrial sector should be concerned about both mean and risk properties in research on new technologies and in the investigation of possible alternative energy inputs This book describes the state of the art in energy usage analysis and production risk applying factor requirement methodology It will be of use as a main or supplementary text in the teaching of advanced graduate courses but also as a reference for those working on empirically advanced research The book is an important addition to the existing literature on industrial development with its focus on energy as a core production input

Operational Thermoluminescence Dosimetry Claudio Furetta,Pao-shan Weng,1998-08-08 This book provides a comprehensive description of a dosimetric technique called thermoluminescence dosimetry There are hundreds of scientific papers on thermoluminescence and its applications but none deal with the handling of the technique except for some official documents regarding procedural tests which are now not easily found For this reason the authors have written this book with the aim of describing in detail how to use this dosimetric method This volume is a valuable guide not only on the proper handling of the TL dosimeters but also on the results obtained by their use The book consists of nine chapters The first three chapters cover the theory of thermoluminescence and the experimental methods used to evaluate the kinetics parameters The next three chapters describe the practical aspects of setting up a thermoluminescent dosimetric system specifically suggesting the procedures to be used in handling the TL dosimeters as well as all the related instrumentation The algorithm correlating the TL emission to the radiation dosage is provided and explained The precision and accuracy of the TL

measurements are also discussed The last three chapters are devoted to i the practical procedure used in some specific application fields ii a discussion about the lower limit of detection and iii the TL instrumentation Several practical illustrative examples are given throughout the text The book is intended for students and researchers learning new techniques and those working in the area of radiation dosimetry with a specific interest in the TL technique Elements of Multivariate Time Series Analysis Gregory C. Reinsel, 2012-12-06 The use of methods of time series analysis in the study of multivariate time series has become of increased interest in recent years Although the methods are rather well developed and understood for univariate time series analysis the situation is not so complete for the multivariate case This book is designed to introduce the basic concepts and methods that are useful in the analysis and modeling of multivariate time series with illustrations of these basic ideas The development includes both traditional topics such as autocovariance and autocorrelation matrices of stationary processes properties of vector ARMA models forecasting ARMA processes least squares and maximum likelihood estimation techniques for vector AR and ARMA models and model checking diagnostics for residuals as well as topics of more recent interest for vector ARMA models such as reduced rank structure structural indices scalar component models canonical correlation analyses for vector time series multivariate unit root models and cointegration structure and state space models and Kalman filtering techniques and applications This book concentrates on the time domain analysis of multivariate time series and the important subject of spectral analysis is not considered here For that topic the reader is referred to the excellent books by Jenkins and Watts 1968 Hannan 1970 Priestley 1981 and others *Doomed Firms* P.J. Cybinski, 2018-12-13 This title was first published in 2003 This book provides a much needed comprehensive and up to date treatise on financial distress modelling Since many of the challenges facing researchers of financial distress can only be addressed by a totally new research design and modelling methodology this book concentrates on extending the potential for bankruptcy analysis from single equation modelling to multi equation analysis Essentially the work provides an innovative new approach by comparing each firm with itself over time rather than testing specific hypotheses or improving predictive and classificatory accuracy Added to this new design a whole new methodology or way of modelling the process is applied in the form of a family of models of which the traditional single equation logit or MDA models is just a special case Preliminary two equation and three equation models are presented and tested in the final chapters as a taste of things to come The groundwork for a full treatise on these sorts of multi equation systems is laid for further study this family of models could be used as a basis for more specific applications to different industries and to test hypotheses concerning influential variables to bankruptcy risk **COMPSTAT** Jelke G. Bethlehem, Peter G. M. van der Heijden, 2000 This book contains the keynote invited and full contributed papers presented at COMPSTAT 2000 held in Utrecht The papers range over all aspects of the link between statistical theory and applied statistics with special attention for developments in the area of official statistics The papers have been thoroughly refereed
