Numbers First Step Math:

First Steps for Math Olympians: Using the American Mathematics Competitions J. Douglas Faires, 2020-10-26

Any high school student preparing for the American Mathematics Competitions should get their hands on a copy of this book. A major aspect of mathematical training and its benefit to society is the ability to use logic to solve problems. The American Mathematics Competitions AMC have been given for more than fifty years to millions of high school students. This book considers the basic ideas behind the solutions to the majority of these problems and presents examples and exercises from past exams to illustrate the concepts. Anyone taking the AMC exams or helping students prepare for them will find many useful ideas here. But people generally interested in logical problem solving should also find the problems and their solutions interesting. This book will promote interest in mathematics by providing students with the tools to attack problems that occur on mathematical problem solving exams and specifically to level the playing field for those who do not have access to the enrichment programs that are common at the top academic high schools. The book can be used either for self study or to give people who want to help students prepare for mathematics exams easy access to topic oriented material and samples of problems based on that material. This is useful for teachers who want to hold special sessions for students but it is equally valuable for parents who have children with mathematical interest and ability. As students problem solving abilities improve they will be able to comprehend more difficult concepts requiring greater mathematical ingenuity. They will be taking their first steps towards becoming math Olympians.

Numbers and Equations Siddhartha Sen, 2012-06-20 The book will be of interest to students teachers and all those who want to understand and use mathematics. Starting from counting numbers key concepts are developed in a step by step easy to follow way.

The Math Instinct Keith Devlin, 2009-04-29 There are two kinds of math the hard kind and the easy kind. The easy kind practiced by ants shrimp Welsh corgis and us is innate. What innate calculating skills do we humans have. Leaving aside built in mathematics such as the visual system ordinary people do just fine when faced with mathematical tasks in the course of the day. Yet when they are confronted with the same tasks presented as math their accuracy often drops. But if we have innate mathematical ability why do we have to teach math and why do most of us find it so hard to learn. Are there tricks or strategies that the ordinary person can do to improve mathematical ability. Can we improve our math skills by learning from dogs cats and other creatures that do math. The answer to each of these questions is a qualified yes. All these examples of animal math suggest that if we want to do better in the formal kind of math we should see how it arises from natural mathematics. From NPR's Math Guy. The Math Instinct will provide even the most number phobic among us with confidence in our own mathematical abilities.

Burn Math Class Jason Wilkes, 2016-03-22 A manifesto for a mathematical revolution Forget everything you've been taught about math In Burn Math Class Jason Wilkes takes the traditional approach to how we learn math with its unwelcoming textbooks unexplained rules and authoritarian assertions and sets it on fire Focusing on how mathematics is created rather than on mathematical facts Wilkes teaches the subject in a way that requires no memorization and no prior knowledge beyond addition and multiplication From these simple foundations Burn Math Class shows how mathematics can be re-invented from scratch without preexisting textbooks and courses We can discover math on our own through experimentation and failure without appealing to any outside authority When math is created free from arcane notations and pretentious jargon that hide the simplicity of mathematical concepts it can be understood organically and it becomes fun Following this unconventional approach Burn Math Class leads the reader from the basics of elementary arithmetic to various advanced topics such as time dilation in special relativity Taylor series and calculus in infinite dimensional spaces Along the way Wilkes argues that orthodox mathematics education has been teaching the subject backward calculus belongs before many of its so-called prerequisites and those prerequisites cannot be fully understood without calculus Like the smartest craziest teacher you've ever had Wilkes guides you on an adventure in mathematical creation that will radically change the way you think about math Revealing the beauty and simplicity of this timeless subject Burn Math Class turns everything that seems difficult about mathematics upside down and sideways until you understand just how easy math can be

Martin, 2019-12-06 Currently in education everyone is debating what is required to turn around struggling campuses Some argue the need for additional programs some suggest merit pay to bring in and retain the most effective teachers What this book will argue is that it rests solely on the shoulders of the principal As the book will discuss it is the principals job to hire and train quality teachers to ensure students receive the high quality instruction they deserve In order for principals to accomplish this task there are certain aspects of instructional leadership they must understand and be able to put into practice Principals first and foremost must truly understand instruction Principals must understand how to evaluate students and teachers through formative assessment Principals have to find ways to get into classrooms as opposed to finding ways that keep them out Finally principals must understand data well enough that they can truly hear the story the data is telling It is through these aspects of instructional leadership that principals are able to turn campuses around **Bulletin -**

are three kinds of articles in this ENCYCLOPAEDIA First of all there are survey type articles dealing with the various main directions in mathematics where a rather fine subdivision has been used The main requirement for these articles has been that they should give a reasonably complete up to date account of the current state of affairs in these areas and that they should be maximally accessible On the whole these articles should be understandable to mathematics students in their first specialization years to graduates from other mathematical areas and depending on the specific subject to specialists in other domains of science engineers and teachers of mathematics These articles treat their material at a fairly general level and aim to give an idea of the kind of problems techniques and concepts involved in the area in question They also contain background and motivation rather than precise statements of precise theorems with detailed definitions and technical details on how to carry out proofs and constructions The second kind of article of medium length contains more detailed concrete problems results and techniques
