**Particles in the Coastal Ocean** Daniel R. Lynch, 2015 This book summarizes the modeling of the transport evolution and fate of particles in the coastal ocean for advanced students and researchers *Tools for Computational Finance* Rüdiger U. Seydel, 2012-03-09 The disciplines of financial engineering and numerical computation differ greatly however computational methods are used in a number of ways across the field of finance It is the aim of this book to explain how such methods work in financial engineering specifically the use of numerical methods as tools for computational finance By

concentrating on the field of option pricing a core task of financial engineering and risk analysis this book explores a wide range of computational tools in a coherent and focused manner and will be of use to the entire field of computational finance Starting with an introductory chapter that presents the financial and stochastic background the remainder of the book goes on to detail computational methods using both stochastic and deterministic approaches Now in its fifth edition *Tools for Computational Finance* has been significantly revised and contains A new chapter on incomplete markets which links to new appendices on Viscosity solutions and the Dupire equation Several new parts throughout the book such as that on the calculation of sensitivities Sect 3 7 and the introduction of penalty methods and their application to a two factor model Sect 6 7 Additional material in the field of analytical methods including Kim s integral representation and its computation Guidelines for comparing algorithms and judging their efficiency An extended chapter on finite elements that now includes a discussion of two asset options Additional exercises figures and references Written from the perspective of an applied mathematician methods are introduced as tools within the book for immediate and straightforward application A learning by calculating approach is adopted throughout this book enabling readers to explore several areas of the financial world Interdisciplinary in nature this book will appeal to advanced undergraduate students in mathematics engineering and other scientific disciplines as well as professionals in financial engineering

Robust Static Super-replication of Barrier Options

Jan H. Maruhn, 2009 Static hedge portfolios for barrier options are very sensitive with respect to changes of the volatility surface To prevent potentially significant hedging losses this book develops a static super replication strategy with market typical robustness against volatility skew and liquidity risk as well as model errors Empirical results and various numerical examples confirm that the static superhedge successfully eliminates the risk of a changing volatility surface Combined with associated sub replication strategies this leads to robust price bounds for barrier options which are also relevant in the context of dynamic hedging The mathematical techniques used to prove appropriate existence duality and convergence results range from financial mathematics stochastic and semi infinite optimization convex analysis and partial differential equations to semidefinite programming

*Analytical Methods for Nonlinear Oscillators and Solitary Waves* Chu-Hui He, Hamid M. Sedighi, Ji-Huan He, Yusry El-Dib, Dragan Marinkovic, 2023-11-24 The most well known analytical method is the perturbation method which has led to the great discovery of Neptune in 1846 and since then mathematical prediction and empirical observation became two sides of a coin in physics However the perturbation method is based on the small parameter assumption and the obtained solutions are valid only for weakly nonlinear equations which have greatly limited their applications to modern physical problems To overcome the shortcomings many mathematicians and physicists have been extensively developing various technologies for several centuries however there is no universal method for all nonlinear problems and mathematical prediction with remarkably high accuracy is still much needed for modern physics for example the solitary waves traveling along an unsmooth boundary the low frequency property of a harvesting energy device the pull

in voltage in a micro electromechanical system Now various effective analytical methods have appeared in the open literature e g the homotopy perturbation method and the variational iteration method An analytical solution provides a fast insight into its physical properties of a practical problem e g frequency amplitude relation of a nonlinear oscillator solitary wave in an optical fiber pull in instability of a microelectromechanical system making mathematical prediction even more attractive in modern physics Nonlinear physics has been developing into a new stage where the fractal fractional differential equations have to be adopted to describe more accurately discontinuous problems and it becomes ever more difficult to find an analytical solution for such nonlinear problems and the analytical methods for fractal fractional differential equations have laid the foundations for nonlinear physics Fiscal Policy, Public Debt and the Term Structure of Interest Rates Roland Demmel, 2012-12-06 The introduction of the thesis consists of four parts first we motivate our chosen macroeconomic setting by looking at some real world phenomena For a better understanding of these phenomena we argue that the mutual dynamic interactions between fiscal policy and financial markets need to be closely examined in a macroeconomic framework Second we review different strands of the economic literature in order to show that most of the literature has so far exclusively concentrated either on financial market dynamics or on fiscal policy issues We conclude that a more integrated model setting is called for in order to explain the dynamic interactions observed in reality Third we discuss at length the economic assumptions underlying our model This avoids multiple repetition later on Finally we outline the structure of the thesis and the objectives we pursue in the different chapters 1 1 Motivation Fiscal policy and financial market reactions are increasingly receiving world wide attention The most recent examples are the Maastricht criteria about fiscal control the South East Asia financial crisis and the resulting IMF policy stance the high level of public debt in developed and developing countries and the effect on interest rates and economic growth In contrast to the still underdeveloped theoretical literature on these dynamic links finding empirical evidence that supports the existence of these links is not a very hard task

**Computational Science — ICCS 2004** Marian Bubak, Geert D. van Albada, Peter M.A. Sloot, Jack Dongarra, 2004-05-25 The International Conference on Computational Science ICCS 2004 held in Krak ow Poland June 6 9 2004 was a follow up to the highly successful ICCS 2003 held at two locations in Melbourne Australia and St Petersburg Russia ICCS 2002 in Amsterdam The Netherlands and ICCS 2001 in San Francisco USA As computational science is still evolving in its quest for subjects of investigation and efficient methods ICCS 2004 was devised as a forum for scientists from mathematics and computer science as the basic computing disciplines and application areas interested in advanced computational methods for physics chemistry life sciences engineering arts and humanities as well as computer system vendors and software developers The main objective of this conference was to discuss problems and solutions in all areas to identify new issues to shape future directions of research and to help users apply various advanced computational techniques The event harvested recent developments in computational grids and next generation computing systems tools advanced numerical methods data driven

systems and novel applications such as complex systems, nanotechnology, economics, physics and population evolution      Advances in Applied Mathematics Ali R. Ansari, 2014-08-04 This volume contains contributions from the Gulf International Conference in Applied Mathematics held at the Gulf University for Science Technology. The proceedings reflect the three major themes of the conference. The first of these was mathematical biology including a keynote address by Professor Philip Maini. The second theme was computational science/numerical analysis including a keynote address by Professor Grigori Shishkin. The conference also addressed more general applications topics with papers in business applications, fluid mechanics, optimization, scheduling problems and engineering applications as well as a keynote by Professor Ali Nayfeh      **Design and Evaluation of a Directional Antenna for Ocean Buoys** Daniel E. Frye, Kenneth Doherty, Al Hinton, 1997 A system concept has been developed by Viasat Inc and Woods Hole Oceanographic Institution for improving the data telemetry bandwidth available on ocean buoys. This concept utilizes existing communications satellites as data relay stations and mechanically steered antenna arrays to achieve increased data rates and improved power efficiency needed for ocean applications. This report describes an initial feasibility and design study to determine if a mechanically steered antenna array can meet the requirements of open ocean buoy applications. To meet the system requirements an 18 element microstrip antenna 9 element transmit 9 element receive was designed and fabricated under subcontract by Seavey Engineering Associates Inc. It operates in the 4-6 GHz frequency band, C band and provides 14 dB of gain. The 3 dB power beamwidth is  $\pm 150^\circ$  in azimuth and elevation. This antenna design in conjunction with a simple rotating mount was used to evaluate the potential of this approach to keep a geostationary satellite in view when mounted on an ocean buoy. The evaluation is based on laboratory measurements using a magnetic compass and a small stepper motor to maintain antenna orientation while the complete assembly was rotated and tilted at speeds similar to what would be expected on an offshore buoy equipped with a stabilizing wind vane      Motivic Homotopy Theory Bjørn Ian Dundas, 2007 This book is based on lectures given at a summer school on motivic homotopy theory at the Sophus Lie Centre in Nordfjordeid, Norway, in August 2002. Vladimir Voevodsky is one of the founders of the theory and received the Fields medal for his work      **Stochastic Calculus and Financial Applications** J. Michael Steele, 2012-12-06 This book is designed for students who want to develop professional skill in stochastic calculus and its application to problems in finance. The Wharton School course that forms the basis for this book is designed for energetic students who have had some experience with probability and statistics but have not had advanced courses in stochastic processes. Although the course assumes only a modest background, it moves quickly and in the end students can expect to have tools that are deep enough and rich enough to be relied on throughout their professional careers. The course begins with simple random walk and the analysis of gambling games. This material is used to motivate the theory of martingales and, after reaching a decent level of confidence with discrete processes, the course takes up the more demanding development of continuous time stochastic processes, especially Brownian motion. The construction of Brownian motion is given in detail and

enough material on the subtle nature of Brownian paths is developed for the student to evolve a good sense of when intuition can be trusted and when it cannot. The course then takes up the Ito integral in earnest. The development of stochastic integration aims to be careful and complete without being pedantic.

### **Stochastic Systems: Theory And Applications** V S

Pugachev, Igor Sinitsyn, 2002-01-02. This book presents the general theory and basic methods of linear and nonlinear stochastic systems. Stochastic systems are dynamical systems described by stochastic finite and infinite dimensional differential integral integrodifferential difference etc equations. The general StS theory is based on the equations for characteristic functions and functionals. The book outlines StS structural theory including direct numerical methods, methods of normalization, equivalent linearization and parametrization of one and multi dimensional distributions based on moments, quasimoments, semi invariants and orthogonal expansions. Special attention is paid to methods based on canonical expansions and integral canonical representations. About 500 exercises and problems are provided. The authors also consider applications in mathematics and mechanics, physics and biology, control and information processing, operations research and finance.

### **Mathematical Epidemiology** Fred Brauer, Pauline van den Driessche, J. Wu, 2008-04-13

Based on lecture notes of two summer schools with a mixed audience from mathematical sciences, epidemiology and public health, this volume offers a comprehensive introduction to basic ideas and techniques in modeling infectious diseases for the comparison of strategies to plan for an anticipated epidemic or pandemic and to deal with a disease outbreak in real time. It covers detailed case studies for diseases including pandemic influenza, West Nile virus and childhood diseases. Models for other diseases including Severe Acute Respiratory Syndrome, rabies and sexually transmitted infections are included as applications. Its chapters are coherent and complementary independent units. In order to accustom students to look at the current literature and to experience different perspectives, no attempt has been made to achieve a united writing style or unified notation. Notes on some mathematical background: calculus, matrix algebra, differential equations and probability have been prepared and may be downloaded at the web site of the Centre for Disease Modeling: [www.cdm.yorku.ca](http://www.cdm.yorku.ca).

### *Theory of Stochastic Integrals*

Jorge A. León, 2025-03-14. In applications of stochastic calculus, there are phenomena that cannot be analyzed through the classical Itô theory. It is necessary therefore to have a theory based on stochastic integration with respect to these situations. The theory of Stochastic Integrals aims to provide the answer to this problem by introducing readers to the study of some interpretations of stochastic integrals with respect to stochastic processes that are not necessarily semimartingales, such as Volterra Gaussian processes or processes with bounded  $p$  variation, among which we can mention fractional Brownian motion and Riemann-Liouville fractional process. Features: Self-contained treatment of the topic. Suitable as a teaching or research tool for those interested in stochastic analysis and its applications. Includes original results.

### **Lie Groups** Claudio

Assuchitis a welcome place for both Norwegian and international participants and lecturers The theme for the summer school in 2003 was Algebraic Combinatorics The organizing committee consisted of Gunnar Fløystad and Stein Arild Strømme Bergen Geir Ellingsrud and Kristian Ranestad Oslo and Alexej Rudakov and Sverre Smalø Trondheim The summer school was partly financed by NorFa Nordisk Forskerdanningsakademi With combinatorics reaching into and playing an important part of ever more areas in mathematics in particular algebra algebraic combinatorics was a timely theme The first lecture series Hyperplane arrangements was given by Peter Orlik He came as a refugee to Norway eighteen years old after the insurrection in Hungary in 1956 Despite now having lived more than four decades in the United States he impressed us by speaking fluent Norwegian without a trace of accent The second lecture series Discrete Morse theory and free resolutions was given by Volkmar Welker These two topics originate back in the second half of the nineteenth century with simple problems on arrangements of lines in the plane and Hilbert's syzygy theorem
