Orwoll,Michael Bliziotis,2002-08-02 In Osteoporosis Pathophysiology and Clinical Management leading clinicians and researchers join forces to illuminate in coupled chapters all the major scientific and clinical aspects of osteoporosis On the basic science side topics range from the genetics of osteoporosis and bone turnover markers to androgen action in bone to the basic biology of estrogen and bone On the clinical side the authors present the latest thinking about the use of bone densitometry in treatment the use of vitamin D and its metabolites and the clinical utilization of salmon calcitonin as well as parathyroid and bisphosphonate therapies SERMs and other important treatments *Prevention and Management of Osteoporosis* World Health Organization,2003-12-31 Bone is hard tissue that is in a constant state of flux being built up by bone forming cells called osteoblasts while also being broken down or resorbed by cells known as osteoclasts During childhood and adolescence bone formation is dominant bone length and girth increase

with age ending at early adulthood when peak bone mass is attained Males generally exhibit a longer growth period resulting in bones of greater size and overall strength In males after the age of 20 bone resorption becomes predominant and bone mineral content declines about 4% per decade Females tend to maintain peak mineral content until menopause at which time it declines about 15% per decade Osteoporosis is a disease characterized by low bone mass and structural deterioration of bone tissue leading to bone fragility and an increased susceptibility to fractures especially of the hip spine and wrist Osteoporosis occurs primarily as a result of normal ageing but can arise as a result of impaired development of peak bone mass e g due to delayed puberty or undernutrition or excessive bone loss during adulthood e g due to estrogen deficiency in women undernutrition or corticosteroid use Osteoporosis induced fractures cause a great burden to society Hip fractures are the most serious as they nearly always result in hospitalization are fatal about 20% of the time and produce permanent disability about half the time Fracture rates increase rapidly with age and the lifetime risk of fracture in 50 year old women is about 40% similar to that for coronary heart disease In 1990 there were 1.7 million hip fractures alone worldwide with changes in population demographics this figure is expected to rise to 6 million by 2050 To help describe the nature and consequences of osteoporosis as well as strategies for its prevention and management a WHO Scientific Group meeting of international experts was held in Geneva which resulted in this technical report This monograph describes in detail normal bone development and the causes and risk factors for developing osteoporosis The burden of osteoporosis is characterized in terms of mortality morbidity and economic costs Methods for its prevention and treatment are discussed in detail for both pharmacological and non pharmacological approaches For each approach the strength of the scientific evidence is listed The report also provides cost analysis information for potential interventions and discusses important aspects of developing national policies to deal with osteoporosis Recommendations are made to the general population care providers health administrators and researchers Lastly national organizations and support groups are listed by country
