Protein Purification R.K. Scopes, 2013-06-29 New textbooks at all levels of chemistry appear with great regularity. Some fields like basic biochemistry, organic reaction mechanisms and chemical thermodynamics are well represented by many excellent texts and new or revised editions are published sufficiently often to keep up with progress in research. However, some areas of chemistry, especially many of those taught at the graduate level, suffer from a real lack of up-to-date textbooks. The most serious needs occur in fields that are rapidly changing. Textbooks in these subjects usually have to be written by scientists actually involved in the research which is advancing the field. It is not often easy to persuade such individuals to set time aside to help spread the knowledge they have accumulated. Our goal in this series is to pinpoint areas of chemistry where recent progress has outpaced what is covered in any available textbooks and then seek out and persuade experts in these fields to produce relatively concise but instructive introductions to their fields. These should serve the needs of one semester or one quarter graduate courses in chemistry and biochemistry. In some cases the availability of texts in active research areas should help stimulate the creation of new courses. New York: CHARLES R. Scopes, 2013-02-14

Protein Stability and Folding Wolfgang Pfeil, 2012-12-06 Protein folding remains one of the most exclusive problems of modern biochemistry. Structure analysis has given access to the wealth of the molecular architecture of proteins. As architecture needs static calculations, protein structure is always related to thermodynamic factors that govern folding and stability of a particular folded protein over the non organized polypeptide chain. During the past decades a huge amount of thermodynamic data

related to protein folding and stability has been accumulated. The data are certainly of importance in deciphering the protein folding problem. At the same time the data can guide the construction of modified and newly synthesized proteins with properties optimized for particular application. The intention of this book is a generation of a data collection which makes the vast amount of present data accessible for multidisciplinary research where chemistry, physics, biology and medicine are involved and also pharmaceutical and food research and technology. It took several years to compile all the data and the author wishes to thank everyone who provided data, ideas or even unpublished results. The author is in particular indebted to Prof. Wadso Lund, Sweden, and IUPAC's Steering Committee on Biophysical Chemistry. Furthermore, support by the Deutsche Forschungsgemeinschaft (DFG) is acknowledged. Principles of Protein Structure, G.E. Schulz, R.H.

Carbohydrates are the most widely distributed naturally occurring organic compounds on Earth. They make up much of our food, clothing and shelter and are as vital to national economies as they are to our diet. This book is the first broad treatment of carbohydrate chemistry in many years and presents the structures, reactions, modifications and properties of carbohydrates. Woven throughout the text are discussions of biological properties of carbohydrates, their industrial applications and the history of the field of carbohydrate chemistry. Written for students as well as practicing scientists, this text/reference will be of interest to a wide range of disciplines influenced by carbohydrates: biochemistry, chemistry, food and nutrition, microbiology, pharmacology and medicine.
