Proteins and Nucleic Acids in Plant Systematics U. Jensen, D.E. Fairbrothers, 2012-12-06 **Systematics and Evolution of the Ranunculiflorae** Uwe Jensen, Joachim W. Kadereit, 2012-12-06 The volume presents current ideas about the systematics and evolution of the Ranunculiflorae and most of its constituent families A strong effort has been made to integrate DNA and morphological anatomical etc evidence and new ideas about the origin and phylogeny of the entire group as well as the Berberidaceae Lardizabalaceae Ranunculaceae and Papaveraceae are arrived at *Evolutionary Biology* Max Hecht, 2012-12-06 *Evolutionary Biology* of which this is the nineteenth volume continues to offer its readers a wide range of original articles reviews and commentaries on evolution in the broadest sense of that term The topics of the reviews range from anthropology and behavior to molecular biology and systematics In recent volumes a broad spectrum of articles have appeared on such subjects as natural selection among replicating molecules in vitro mate recognition and the reproductive behavior in *Drosophila* evolution of the monocotyledons species selection and the communication network made possible among even distantly related genera of bacteria by plasmids and other transposable elements Articles such as these often too long for standard journals are the stuff of *Evolutionary Biology* The editors continue to solicit manuscripts on an international scale in an effort to see that everyone of the many facets of biological evolution is covered Manuscripts should be sent to anyone of the following Max K Hecht Department of Biology Queens College of the City University of New York Flushing New York 11367 Bruce Wallace Department of Biology Virginia Polytechnic Institute and State University Blacksburg Virginia 24061 Ghillian T Prance New York Botanical Garden Bronx New York 10458 The Editors vii Contents 1 Discontinuous Processes in the Evolution of the Bacterial Genome 1 Monica Riley Introduction 1 Internal Rearrangements 2 Large Scale Internal Rearrangements 2 Small Scale Rearrangements Divergence of Duplicate Genes 11 Interactions between Two Genomes 20 Transposons Jumping Genes 20 Plasmids Incorporation into Genomic DNA 23 **Plant Taxonomy and Biosystematics** Clive A. Stace, 1989 A concise up to date and fully integrated discussion of present day plant taxonomy

Plant Systematics Gurcharan Singh, 2004 The book strikes a balance between classical fundamental information and the recent developments in plant systematics Special attention has been devoted to the information on botanical nomenclature identification and phylogeny of angiosperms with numerous relevant examples and detailed explanation of the important nomenclatural problems An attempt has been made to present a continuity between orthodox and contemporary identification methods by working on a common example The methods of identification using computers have been further explored to help better online identification The chapter on cladistic methods has been totally revised and molecular systematics discussed in considerable detail Jacket *Systematic Botany* Bharati Bhattacharyya, 2005 Modern angiosperm taxonomy or systematics provides a strong foundation for the progress of biological sciences as it incorporates studies on biosystematics chemical and serological evidences numerical taxonomy cytogenetical and ecological evidences and many

others This book accounts for information on classical and fundamental aspects of taxonomy as well as its recent developments Special attention has been paid to the chapters on origin of Angiosperms Theory of Evolution and Evolutionary trends in Angiosperm Flowers The International Code of Botanical Nomenclature Important herbaria Techniques for the preparation storage and study of herbarium specimens Botanical gardens and Taxonomic literature are discussed in detail and includes the study of some selected families belonging to 21 orders For each family general features and evidence from anatomical embryological chromosome numbers and phytochemical data have been added and evolutionary trends discussed Attention has also been drawn to economic importance and geographical distribution of these families Illustrations for some members of these families have also been added *DNA-based markers in plants* R.L. Phillips, Indra K. Vasil, 2012-12-06 The double helix architecture of DNA was elucidated in 1953 Twenty years later in 1973 the discovery of restriction enzymes helped to create recombinant DNA molecules in vitro The implications of these powerful and novel methods of molecular biology and their potential in the genetic manipulation and improvement of microbes plants and animals became increasingly evident and led to the birth of modern biotechnology The first transgenic plants in which a bacterial gene had been stably integrated were produced in 1983 and by 1993 transgenic plants had been produced in all major crop species including the cereals and the legumes These remarkable achievements have resulted in the production of crops that are resistant to potent but environmentally safe herbicides or to viral pathogens and insect pests In other instances genes have been introduced that delay fruit ripening or increase starch content or cause male sterility Most of these manipulations are based on the introduction of a single gene generally of bacterial origin that regulates an important monogenic trait into the crop of choice Many of the engineered crops are now under field trials and are expected to be commercially produced within the next few years The early successes in plant biotechnology led to the realization that further molecular improvement of plants will require a thorough understanding of the molecular basis of plant development and the identification and characterization of genes that regulate agronomically important multi genic traits *Biological Approaches and Evolutionary Trends in Plants* Shoichi Kawano, 2012-12-02 Biological Approaches and Evolutionary Trends in Plants is a collection of papers presented at the Fourth International Symposium of Plant Biosystematics held on July 10-14 1989 in Kyoto Japan Contributors some are world's leading plant biologists discuss the findings in evolutionary biology and issues in plant biosystematics in light of the evidence and ideas brought forward at various levels of biological organization from molecule to cell individual population species and community levels This volume is organized into four sections encompassing 22 chapters and begins with an overview of discoveries concerning parapatric differentiation of weed populations including adaptive evolution in herbicide resistant biotypes and complex evolutionary patterns in weed crop complexes of various groups The next section explores molecular approaches in plant biosystematics focusing on amino acid sequencing of proteins restriction site variations of cpDNA mitDNA rDNA etc and chromosome banding patterns revealed by differential staining The discussion shifts to a wave

of research in plant population biology and evolutionary ecology since the 1970s and its impact on biology and biosystematics. The book considers various aspects of reproductive biology and evolutionary changes in significant reproductive parameters and attempts to demographically quantify these parameters. The final chapter is devoted to the use of functional phylogenetic systematics for predictive ecology. This book will be of interest to plant biologists and scientists and researchers in fields such as biochemistry, botany, microbiology, ecology and evolutionary biology. Discoveries in Plant Biology Shain-Dow Kung, Shang-Fa Yang, 1998. The book is a valuable source of information and reference and may also inspire young researchers on how to advance their own field of plant science. This discovery book which is recommended to a wide readership from advanced students to the established scientists should be present in all central libraries and all libraries of plant biology institutions. Journal of Plant Physiology 2000. Biochemical Aspects of Crop Improvement K. R. Khanna, 2024-12-06. This book provides a comprehensive review at the biochemical and molecular level of the processes and techniques that contribute to crop improvement. General topics include a historical perspective of the advancements in crop improvement, cultivar systematics and biochemical and molecular markers in crop improvement programs, the genetics of physiological and biochemical processes affecting crop yield, the genetics of photosynthesis, chloroplast relevant enzymes and mutations, osmoregulation adjustment and the production of protective compounds in relation to drought tolerance and the biochemistry of disease resistance including elicitors, defense response genes, their role in the production of phytoalexins and other strategies against pathogens. Other topics include quality breeding, e.g. molecular gene structure, changing individual amino acids, enhancing nutritive value of proteins and biotechnology, genetic engineering. Geneticists, biochemists, botanists, agricultural specialists and others involved in crop improvement and breeding should consider this volume essential reading.
