BERTIN,GLOWINSKI,PERIAUX,2012-11-28 The task of defining the aerothermodynamic environment for a vehicle flying through the air at hypersonic speeds offers diverse challenges to the designer He must integrate a wide variety of scientific and technical disciplines blending mathematical modeling computational methods and experimental measurements Many of the manned reentry vehicles are relatively blunt or fly at very high angles of attack so that the drag is relatively large and enter the atmosphere at a relatively low entry angle As a result the hypersonic deceleration occurs at very high altitudes Because the conversion of kinetic energy to internal energy modes occurs in a low density environment the flow field chemistry is an important consideration Experiments on the U S Space Shuttle demonstrated the importance of nonequilibrium flow and surface catalyticity on the heating to the vehicle To determine the aerothermodynamic environment of other vehicles operating hypersonically at very high altitudes e g the Aero Assisted Space Transfer Vehicle the designer may have to consider viscous inviscid interactions and the modeling of noncontinuum flows Configurations that have a relatively high ballistic coefficient such as slender reentry vehicles and reenter the atmosphere at relatively high angles of attack experience severe heating rates and high dynamic pressures but only for a short period of time For these vehicles continuum flow models incorporating equilibrium chemistry are reasonable Hypersonics Bertin,1989-01-01
