format on the planning and implementation of alternative cropping systems designed to maximize incident sunlight and bio
support of all crops in a rotation system The book describes the basic component of the system an increased access point of
incident sunlight between each row or pairs of rows that enables a more uniform vertical distribution of incident sunlight to
chloroplasts within the entire corn leaf canopy While the production environment and environment specific genetics
determine the performance potential of this principle by maximizing the principles that light is basic to crop yield a solar
corridor ultimately contributes to increased grain yield Written by experts who were integral in the development of solar
corridor systems and providing real world examples of the methods challenges and future prospects this book will be

valuable for those seeking to increase yield per acre through both primary and cover crops Introduces readers to the concept of alternative row cropping and its implementation Presents real world experience including challenges and solutions Encourages research in maximizing photosynthesis impact on crop yield **Energy Research Abstracts**, 1992-12 *Book Catalog of the Library and Information Services Division: Shelf List catalog* Environmental Science Information Center. all this was due to our sponsors for without their very significant material contributions there would have been no summer school These sponsors included the Scientific Affairs Division of NATO together with the European Association of Remote Sensing Laboratories the Council of Europe the European Space Agency the German Aerospace Establishment DFVLR and the Natural Environment Research Council
