

# Crop respiration rates

- Understanding crop respiration rates is crucial for optimizing plant growth and yield
- Respiration in plants involves converting sugars into energy, releasing carbon dioxide and water as byproducts
- Factors such as temperature, water availability, and crop type influence these rates
- Knowing how to manage and adjust for these factors can lead to more efficient agricultural practices and enhanced food production

## Practical example: Agriculture

- Crop respiration rates are crucial in agriculture for determining the growth and health of plants
- This biological process involves plants taking in oxygen and releasing carbon dioxide, directly impacting their energy production
- Understanding this helps farmers manage crop yields and growth cycles more efficiently
- By analyzing respiration rates, agriculturalists can improve farming methods to enhance productivity and sustainability

**Respiration and Crop Productivity** Jeffrey S. Amthor, 1989-06-23 Respiration is a large and important component of the carbon economy of crops There are already several good books dealing with the biochemistry and physiology of plant respiration but there are none I know of that are devoted to the relationship between respiration and crop productivity although this relationship is more and more frequently being studied with both experiment and simulation Crop physiology books do cover respiration of course but the treatment is limited The purpose of the present book is to fill this void in the literature The approach taken here is to use the popular two component functional model whereby respiration is divided between growth and maintenance components After thoroughly reviewing the literature I came to the conclusion that at present this is the most useful means of considering respiration as a quantitative component of a crop's carbon economy This functional distinction is used as the framework for describing respiration and assessing its role in crop productivity Discussions and critiques of the biochemistry and physiology of respiration serve primarily as a means of more fully understanding and describing the functional approach to studying crop respiration It is assumed that the reader of this book is familiar with the fundamentals of plant physiology and biochemistry The research worker in crop physiology should find this an up to date summary of crop respiration and the functional model of respiration This book is not however a simple review of existing data

Plant Respiration Hans Lambers, Univ. de les Illes Balears, 2006-03-30 Respiration in plants as in all living organisms is essential to provide metabolic energy and carbon skeletons for growth and maintenance As such respiration is an essential component of a plant's carbon budget Depending on species and environmental conditions it

consumes 25-75% of all the carbohydrates produced in photosynthesis even more at extremely slow growth rates. Respiration in plants can also proceed in a manner that produces neither metabolic energy nor carbon skeletons but heat. This type of respiration involves the cyanide-resistant alternative oxidase, which is unique to plants and resides in the mitochondria. The activity of this alternative pathway can be measured based on a difference in fractionation of oxygen isotopes between the cytochrome and the alternative oxidase. Heat production is important in some flowers to attract pollinators; however, the alternative oxidase also plays a major role in leaves and roots of most plants. A common thread throughout this volume is to link respiration, including alternative oxidase activity, to plant functioning in different environments.

Effect of High Temperature on Crop Productivity and Metabolism of Macro Molecules Amitav Bhattacharya, 2019-06-14. This book presents a comprehensive overview on the direct effect of temperatures defined as high, a definition which increasingly includes a great number of geographic regions. As temperature impacts the number of base growth days, it is necessary to adapt plant selection strategies, planting times, and understand the expected impact of adaptive steps to ensure maximum plant health and crop yield. Global warming, climate change, and change in environmental conditions have become common phrases in nearly every scientific seminar, symposium, and meeting; thus, these changes in climatic patterns constrain normal growth and reproduction cycles. This book reviews the effect of high temperature on agricultural crop production and the effect of high temperature stress on the metabolic aspects of macro molecules, including carbohydrates, proteins, fats, secondary metabolites, and plant growth hormones. It focuses on the effects of high temperature on agriculture and the metabolism of important macro molecules, discusses strategies for improving heat tolerance, thus educating plant and molecular breeders in their attempts to improve efficiencies and crop production. It provides information that can be applied today and in future research.

Handbook of Agricultural Productivity Miloslav Rechcigl, 2018-01-18. The greatest challenge of our time is to produce sufficient food to keep pace with the rapidly growing population. In the opinion of experts, during the next 25 years there will be a need for as much food as was produced in the entire history of mankind to date. Of the various measures available, improvement in agricultural productivity is judged as the ultimate means of augmenting food production and supplies. In this Handbook, an international team of experts considers the most important factors affecting production of both crops and livestock. This Handbook is intended as a scientific guide to practitioners and students as well as to researchers who should find here stimulating ideas for further exploration.
