

Restorative Neurology of Spinal Cord Injury

Edited by Milan R. Dimitrijevic, Byron A. Kakulas, W. Barry McKay, and Gerta Vrbová

Following injury or disease, neural circuitry can be altered, leading to highly individualized characteristics that may or may not resemble original function. To date, the majority of approaches used to treat neurological dysfunction have focused on the replacement of lost or damaged function. *Restorative Neurology of Spinal Cord Injury* offers a new and novel approach.

Focusing on the spinal cord and its role in motor control, this book details the clinical and neurophysiological assessment methods developed throughout the past half-century, as well as the conduction and processing performed within the surviving neural circuitry. Based on the results of such assessment, treatment strategies are applied to augment, rather than replace, the performance of surviving neural circuitry and improve the functional capacity of people who have experienced spinal cord injury.

"This 'state of the art' book on restorative neurology of spinal cord injury deals with an interesting and timely topic...The last decade has seen an impressive evolution from the important but limited clinico-pathological correlations to a list of evaluations and interventions...This book gives a good overview of all that has become available for treatment and research. It illustrates how this knowledge can be clinically put into practice. The evolution will not stop today and it is certain that further steps will be made in the new perspective presented here, for the benefit of those who suffer such injury."

Restorative Neurology:

Principles and Practice of Restorative Neurology Robert R Young, Paul J Delwaide, 2013-10-22 Principles and Practice of Restorative Neurology is a collection of topics in clinical neurology where progress through research has brought concepts of patient management The collection emphasizes research done clinically and in experimental laboratories and attempts to discuss restorative neurology in the larger context encompassing biology neurobiology and rehabilitative engineering The book discusses the concept that neurology should be more therapeutic instead of being just diagnostic because of advances in techniques and drugs An epidemiology of disability and the evaluation of restorative neurology are explained The text also presents the developments in the pharmacotherapy of major neurological disorders such as Parkinson's disease dementia and stroke The use of biomechanical or rehabilitation engineering to treat impaired or lost functions in a patient is compared the feedback mechanisms and the kinds of treatment including microsurgery neurostimulation methods surgery and molecular genetics that are applied to specific disorders are discussed extensively The book also reviews the approaches of gene correction for disorders in the central nervous system Finally the future needs of neurology in terms of diagnosis and treatments are dealt with as more research techniques and drugs are being discovered and proved useful The collection is intended for neurologists neurologists in training and other physicians whose work lies with neurological disorders The book can also prove useful for practitioners and academicians in the fields of neurosurgery internal medicine psychiatry and rehabilitation medicine

Restorative Neurology of Spinal Cord Injury Milan R. Dimitrijevic, 2012-01-12 Following injury or disease neural circuitry can be altered to varying degrees leading to highly individualized characteristics that may or may not resemble original function In addition lost or partially damaged circuits and the effects of biological recovery processes coupled with learned compensatory strategies create a new neuroanatomy with capabilities that are often not functional or may interfere with daily life To date the majority of approaches used to treat neurological dysfunction have focused on the replacement of lost or damaged function usually through the suppression of surviving neural activity and the application of mechanical assistive devices Restorative Neurology of Spinal Cord Injury offers a different and novel approach Focusing on the spinal cord and its role in motor control the book details the clinical and neurophysiological assessment process and methods developed throughout the past half century by basic and clinical scientists Then through the use of specialized clinical and neurophysiological testing methods conduction and processing performed within the surviving neural circuitry is examined and characterized in detail Based on the results of such assessment treatment strategies also described in this book are applied to augment rather than replace the performance of surviving neural circuitry and improve the functional capacity of people who have experienced injury to their spinal cords

 SOLOMON H SNYDER Receptor Research Reaches Neurology Relevance to Neurodegenerative Diseases and Stroke
 President George Bush has heralded the 1990s as the decade of the brain based largely on the rapid escalation of advances
 in the molecular neuro sciences and the likelihood that these will bear therapeutic fruit before the turn of the century There
 is little doubt that the 1970s and 1980s have witnessed more remarkable advances in the molecular neurosciences than all of
 the preceding hundred years Identification of receptor sites for drugs and neurotransmitters along with simple sensitive and
 specific means of monitoring them has made it possible to elucidate the mechanism of action for many known drugs and to
 identify new chemical entities as potential therapeutic agents At the same time the numbers of distinct neurotransmitters
 have multiplied Prior to 1970 only the biogenic amines were well accepted as transmitters The early 1970s witnessed the
 gradual acceptance of amino acids as major excitatory and inhibitory neurotransmitters Identification of opiate receptors and
 the subsequent identification of the enkephalins as their endogenous ligands led to an appreciation of peptides as putative
 transmitters and the accumulation of as many as a hundred neuropeptides by the decade's end In the 1980s the revolutions
 of molecular biology have been applied aggressively to the neurosciences with molecular cloning for neuropeptide precursors

many important neurochemical enzymes and receptors for numerous transmitters
