Experimental Embryology in Aquatic Plants and Animals Hans-Jurg Marthy, 2012-12-06 The NATO Advanced Study Institute on Experimental Embryology in Aquatic Plant and Animal Organisms was attended by more than 70 participants including 15 invited main lecturers from 18 different countries In accordance with the main purpose of the meeting senior scientists postdoctoral investigators and graduate students working in areas of descriptive and experimental embryology classical molecular and developmental biology physiology and biochemistry etc were brought together for two weeks as a community with a strong common interest in development that is the multiple phenomena and mechanisms in molecular cellular genetic and organismic terms observed in the development of aquatic organisms Initial concern that the great variety of biological models as well as of research subjects would harm the scientific quality and coherency of the course was unnecessary It was exactly this breadth which made the Institute worthwhile for each of the participants Since many of the students were younger scientists starting a career it was the main goal of the course to offer a concise overview of selected system models of primarily aquatic organisms and to present and discuss research carried out in the past and in progress Thus each main speaker gave two in depth lectures one in which he presented an overview of his model and another dealing with current investigations

Marine Research, 1969 The Inconstant Gene Lawrence Dillon, 2013-11-11 Why should the gene be suggested to be inconstant when the contrary view that gene structure is invariant except through mutagenic processes induced by potent external factors has long been a universal doctrine of genetics Indeed during the early part of the present century before mutation was recognized as being of general occurrence the seeming unvarying nature of the gene led to skepticism regarding the validity of the evolutionary theory only later could the origins of the morphological differences between individuals and species be attributed to a combination of mutation and evolution involving natural forces selecting between favorable and unfavorable genetic changes But during the past several decades as knowledge of the macromolecular constitution of organisms has increased to the point where even the primary structures of the genes themselves are being revealed on a routine basis it has become increasingly difficult to ascribe all the resulting observations to ordinary mutagenesis and natural selection Some more profound mechanism often seems to be present that influences both the constancy and inconstancy of the genes an apparatus whose existence this study hopes to reveal In seeking to demonstrate the universality of this mechanism data are sought through the numerous activities of organisms of many types wherever gene action changes are manifest
