Number Theory Henri Cohen, 2008-12-17 This book deals with several aspects of what is now called explicit number theory The central theme is the solution of Diophantine equations i e equations or systems of polynomial equations which must be solved in integers rational numbers or more generally in algebraic numbers This theme in particular is the central motivation for the modern theory of arithmetic algebraic geometry In this text this is considered through three of its most basic aspects The local aspect global aspect and the third aspect is the theory of zeta and L functions This last aspect can be considered as a unifying theme for the whole subject **Automorphic Forms and Even Unimodular Lattices** Gaëtan Chenevier, Jean Lannes, 2019-02-28 This book includes a self contained approach of the general theory of quadratic forms and integral Euclidean lattices as well as a presentation of the theory of automorphic forms and Langlands conjectures ranging from the first definitions to the recent and deep classification results due to James Arthur Its connecting thread is a question about lattices of rank 24 the problem of p neighborhoods between Niemeier lattices This question whose expression is quite elementary is in fact very natural from the automorphic point of view and turns out to be surprisingly intriguing We explain how the new advances in the Langlands program mentioned above pave the way for a solution This study proves to be very rich leading us to classical themes such as theta series Siegel modular forms the triality principle L functions and congruences between Galois representations This monograph is intended for any mathematician with an interest in Euclidean lattices automorphic forms or number theory A large part of it is meant to be accessible to non specialists
