

SPECTRAL INVARIANCE OF PSEUDODIFFERENTIAL BOUNDARY VALUE PROBLEMS ON MANIFOLDS WITH CONICAL SINGULARITIES

PEDRO T. P. LOPES AND ELMAR SCHROBE

ABSTRACT. We prove the spectral invariance of the algebra of classical pseudodifferential boundary value problems on manifolds with conical singularities in the L_p -setting. As a consequence we also obtain the spectral invariance of the classical Boutet de Monvel algebra of zero order operators with parameters. In order to establish these results, we show the equivalence of Fredholm property and ellipticity for both cases.

1. INTRODUCTION

Elliptic boundary value problems on manifolds with conical singularities have been studied since the 60's, where the work of V. A. Kondratiev [14] stands out, see also Kozlov, Maz'ya and Rossmann [15] for a detailed presentation. The pseudodifferential analysis started with the work of R. Melrose and G. Mendoza [19, 20], B. Plamenevsky [21], and B. -W. Schulze [29]. Algebras of pseudodifferential boundary value problems for conical singularities were constructed in the 90's by A. O. Derviz [7] and E. Schrobe and B. -W. Schulze [25, 26]. The latter approach combines elements of the Boutet de Monvel calculus [3] with the pseudodifferential analysis developed by B. -W. Schulze [28, 29]. While initially only L_2 -based Sobolev spaces were used, S. Coriasco, E. Schrobe and J. Seiler established the continuity also on Bessel potential and Besov spaces [5], see also [4], relying on work of G. Grubb and N. Kokholm [9, 12].

Our main result is the spectral invariance of the algebra developed in [26] in the L_p -setting, see Theorem 61. This algebra contains, after the composition with order reducing operators, the classical differential boundary value problems studied by V. A. Kondratiev [14], hence also their inverses, whenever these exist. As a by-product we obtain the spectral invariance of the algebra of zero order classical Boutet de Monvel operators with parameters in the L_p -setting, see Theorem 29. This algebra includes, after composition with order reducing operators, the differential boundary value problems studied by M. S. Agranovich and M. I. Vishik in [1], which were an important ingredient for the work of Kondratiev.

It is an immediate consequence of Theorem 61 that the invertibility of a conically degenerate boundary value problem is to a large extent independent of the space it is considered on: It depends neither on the Sobolev regularity parameter s nor on $1 < p < \infty$. This is of great practical importance as it allows to check invertibility in the most convenient setting. A similar result holds for the Fredholm property, as we show in Corollary 50.

Parabolicity, Volterra Calculus, and Conical Singularities Sergio Albeverio, Michael Demuth, Elmar Schrohe, Bert-Wolfgang Schulze, 2012-12-06 Partial differential equations constitute an integral part of mathematics. They lie at the interface of areas as diverse as differential geometry, functional analysis, or the theory of Lie groups and have numerous applications in the applied sciences. A wealth of methods has been devised for their analysis. Over the past decades, operator algebras in connection with ideas and structures from geometry, topology, and theoretical physics have contributed a large variety of particularly useful tools. One typical example is the analysis on singular configurations where elliptic equations have been studied successfully within the framework of operator algebras with symbolic structures adapted to the geometry of the underlying space. More recently, these techniques have proven to be useful also for studying parabolic and hyperbolic equations. Moreover, it turned out that many seemingly smooth noncompact situations can be handled with the ideas from singular analysis. The three papers at the beginning of this volume highlight this aspect. They deal with parabolic equations, a topic relevant for many applications. The first article prepares the ground by presenting a calculus for pseudo differential operators with an anisotropic analytic parameter. In the subsequent paper, an algebra of Mellin operators on the infinite space time cylinder is constructed. It is shown how timelike infinity can be treated as a conical singularity. **Pseudo-Differential**

Kapanadze, Bert-Wolfgang Schulze, 2013-03-14 Boundary value problems for partial differential equations play a crucial role in many areas of physics and the applied sciences. Interesting phenomena are often connected with geometric singularities, for instance in mechanics. Elliptic operators in corresponding models are then singular or degenerate in a typical way. The necessary structures for constructing solutions belong to a particularly beautiful and ambitious part of the analysis. Cracks in a medium are described by hypersurfaces with a boundary. Configurations of that kind belong to the category of spaces, manifolds with geometric singularities here with edges. In recent years, the analysis on such in general stratified spaces has become a mathematical structure theory with many deep relations with geometry, topology and mathematical physics. Key

words in this connection are operator algebras index theory quantisation and asymptotic analysis Motivated by Lamé's system with two sided boundary conditions on a crack we ask the structure of solutions in weighted edge Sobolov spaces and subspaces with discrete and continuous asymptotics Answers are given for elliptic systems in general We construct parametrices of corresponding edge boundary value problems and obtain elliptic regularity in the respective scales of weighted spaces The original elliptic operators as well as their parametrices belong to a block matrix algebra of pseudo differential edge problems with boundary and edge conditions satisfying analogues of the Shapiro Lopatinskij condition from standard boundary value problems Operators are controlled by a hierarchy of principal symbols with interior boundary and edge components

Aspects of Boundary Problems in Analysis and Geometry Juan Gil, Thomas Krainer, Ingo Witt, 2012-12-06 Boundary problems constitute an essential field of common mathematical interest The intention of this volume is to highlight several analytic and geometric aspects of boundary problems with special emphasis on their interplay It includes surveys on classical topics presented from a modern perspective as well as reports on current research The collection splits into two related groups analysis and geometry of geometric operators and their index theory elliptic theory of boundary value problems and the Shapiro Lopatinsky condition

Differential Equations, Asymptotic Analysis, and Mathematical Physics Michael Demuth, Bert-Wolfgang Schulze, 1997 This volume contains a collection of original papers associated with the International Conference on Partial Differential Equations held in Potsdam July 29 to August 2 1996 The conference has taken place every year on a high scientific level since 1991 this event is connected with the activities of the Max Planck Research Group for Partial Differential Equations at Potsdam Outstanding researchers and specialists from Armenia Belarus Belgium Bulgaria Canada China France Germany Great Britain India Israel Italy Japan Poland Romania Russia Spain Sweden Switzerland Ukraine and the USA contribute to this volume The main topics concern recent progress in partial differential equations microlocal analysis pseudo differential operators on manifolds with singularities aspects in differential geometry and index theory operator theory and operator algebras stochastic spectral analysis semigroups Dirichlet forms Schrodinger operators semiclassical analysis and scattering theory

Spectral Problems Associated with Corner Singularities of Solutions to Elliptic Equations Vladimir Kozlov, V. G. Maz'ya, Jürgen Rossmann, 2001 This book focuses on the analysis of eigenvalues and eigenfunctions that describe singularities of solutions to elliptic boundary value problems in domains with corners and edges The authors treat both classical problems of mathematical physics and general elliptic boundary value problems The volume is divided into two parts The first is devoted to the power logarithmic singularities of solutions to classical boundary value problems of mathematical physics The second deals with similar singularities for higher order elliptic equations and systems Chapter 1 collects basic facts concerning operator pencils acting in a pair of Hilbert spaces Related properties of ordinary differential equations with constant operator coefficients are discussed and connections with the theory of general elliptic boundary value problems in domains with conic vertices are

outlined New results are presented Chapter 2 treats the Laplace operator as a starting point and a model for the subsequent study of angular and conic singularities of solutions Chapter 3 considers the Dirichlet boundary condition beginning with the plane case and turning to the space problems Chapter 4 investigates some mixed boundary conditions The Stokes system is discussed in Chapters 5 and 6 and Chapter 7 concludes with the Dirichlet problem for the polyharmonic operator Chapter 8 studies the Dirichlet problem for general elliptic differential equations of order $2m$ in an angle In Chapter 9 an asymptotic formula for the distribution of eigenvalues of operator pencils corresponding to general elliptic boundary value problems in an angle is obtained Chapters 10 and 11 discuss the Dirichlet problem for elliptic systems of differential equations of order 2 in an n dimensional cone Chapter 12 studies the Neumann problem for general elliptic systems in particular with eigenvalues of the corresponding operator pencil in the strip $m - 2n \leq \operatorname{Re} \lambda \leq m - 2n + 1$ It is shown that only integer numbers contained in this strip are eigenvalues Applications are placed within chapter introductions and as special sections at the end of chapters Prerequisites include standard PDE and functional analysis courses
