Nuclear Imaging in Drug Discovery, Development, and Approval BURNS, 2012-12-06 It is the purpose and business of the pharmaceutical industry to discover develop and make available drugs for the care of the sick The purpose of universities and national laboratories is to provide people and scientific knowledge that can help in the process This book presents the combined efforts of scientists from the drug industry academic laboratories and national laboratories to describe advances in radiotracer technology in studies on experimental animals and living human beings The authors believe that the technology is now ready for widespread application in the pharmaceutical industry The goal of this book is to help bring this about The field of Nuclear Medicine is based on the

concept that if treatment of disease is chemical the patient's diagnosis should be chemical. Anatomy and histopathology have been the principle basis for making a diagnosis. Histopathologic data suffer from being descriptive, subjective, not quantifiable and based on the study of dead tissue. The era of histopathology as the dominant concept in medical practice is coming to an end. Histopathologic findings are often heterogeneous and a single biopsy will at times not reveal the true nature of the disease such as the grading of malignancy. Far greater accuracy of staging of disease and in the planning of treatment is possible through chemistry as well as by making possible a more suitable selection of a histological biopsy site.

Introduction To Radiation Protection Dosimetry Jozef Sabol, Pao-shan Weng, 1995-04-28 One essential characteristic of life is the exchange of matter and energy between organisms and their environment. Radiation is a form of energy that has always been around in nature and will forever be the companion of human beings throughout life. In order to assess the impact of radiation exposures properly it is essential to introduce appropriate quantities and units which can then be used for quantification of exposures from various sources. In principle radiation protection is mainly aimed at controlling radiation exposure while radiation dosimetry deals primarily with the measurement of relevant radiation quantities especially doses. This book is divided into two parts. The first contains up to date definitions of the most significant radiation quantities including their interpretation. In the second part the exposures of both individuals and population at large to various types of natural and man made sources are compared and discussed. The concept of quantities and units as well as analysis of exposure due to various sources in our environment is based on the latest highly regarded authentic sources such as ICRU, ICRP, IAEA and particularly UNSCEAR reports and recommendations. The material reflects the latest review of the current terminology in radiation protection dosimetry and the contemporary assessment of radiation exposures of the population, radiation workers and patients.
