

Power in resistive and reactive AC circuits

Consider a circuit for a single-phase AC power system, where a 120 volt, 60 Hz AC voltage source is delivering power to a resistive load. (Figure [below](#))

Ac source drives a purely resistive load.

$$Z_R = 60 + j0 \, \Omega \quad \text{or} \quad 60 \, \Omega \angle 0^\circ$$

$$I = \frac{E}{Z}$$

$$I = \frac{120 \, \text{V}}{60 \, \Omega}$$

$$I = 2 \, \text{A}$$

In this example, the current to the load would be 2 amps, RMS. The power dissipated at the load would be 240 watts. Because this load is purely resistive (no reactance), the current is in phase with the voltage, and calculations look similar to that in an equivalent DC circuit. If we were to plot the voltage, current, and power waveforms for this circuit, it would look like Figure [below](#).
