Retinal Degenerative Diseases Catherine Bowes Rickman,Christian Grimm,Robert E. Anderson,John D. Ash,Matthew M. LaVail,Joe G. Hollyfield,2019-12-28 This book contains the proceedings of the XVIII International Symposium on Retinal Degeneration RD2018 A majority of those who spoke and presented posters at the meeting contributed to this volume The blinding diseases of inherited retinal degenerations have no treatments and age related macular degeneration has no cures despite the fact that it is an epidemic among the elderly with 1 in 3 4 affected by the age of 70 The RD Symposium focused on the exciting new developments aimed at understanding these diseases and providing therapies for them Since most major scientists in the field of retinal degenerations attend the biennial RD Symposia they are known by most as the best and most important meetings in the field The volume presents representative state of the art research in almost all areas of retinal degenerations ranging from cytopathologic physiologic diagnostic and clinical aspects animal models mechanisms of cell death candidate genes cloning mapping and other aspects of molecular genetics and developing potential therapeutic measures such as gene therapy and neuroprotective agents for potential pharmaceutical therapy While advances in these areas of retinal degenerations were described there will be many new topics that either are in their infancy or did not exist at the time of the last RD Symposium RD2016 These include the role of inflammation and immunity as well as other basic mechanisms in age related macular degeneration several new aspects of gene therapy and revolutionary new imaging and functional testing that will have a huge impact on the diagnosis and following the course of retinal degenerations as well as to provide new quantitative endpoints for clinical trials The retina is an approachable part of the central nervous system CNS and there is a major interest in neuroprotective and gene therapy for CNS diseases and neurodegenerations in general It should be noted that with successful and exciting initial clinical trials in neuroprotective and gene therapy including the restoration of sight in blind children the retinal degeneration therapies are leading the way towards new therapeutic measures for neurodegenerations of the CNS Many of the successes recently reported in these areas of retinal degeneration sprang from collaborations established at previous RD Symposia and many of those were reported at the RD2016 meeting and included in the current volume We anticipate the excitement of those working in the field and those afflicted with retinal degenerations is reflected in the volume

neuroscience and art history this book offers a comprehensive and thought provoking examination of blindness and its implications for our understanding of the world The book begins by examining the physiological and psychological processes of vision How do our eyes work How does the brain interpret visual information And what happens when these processes are disrupted or impaired We will also explore the cultural and historical contexts of blindness from the ancient Greeks who believed that blindness was a curse of the gods to the modern day assistive technologies that are helping to improve the lives of blind people The book then moves on to consider the philosophical and existential implications of blindness What does it mean to be blind How does blindness affect our understanding of the world And what can blindness teach us about the nature of reality These are profound questions that have been pondered by philosophers theologians and artists for centuries and we will explore them in depth in this book One of the most fascinating aspects of blindness is the way it can sharpen the other senses When one sense is lost the others often become more acute in order to compensate This can lead to a heightened awareness of the world around us a deeper appreciation for the beauty of nature and a more profound understanding of our own place in the universe Finally the book concludes with a look at the future of sight With the rapid advances in medical technology there is hope that one day blindness may be curable But even if a cure is never found there is still much that can be done to improve the lives of blind people From assistive technologies to social and cultural changes we are slowly but surely creating a world that is more inclusive and accessible to people with visual impairments Sight and Unseen is an essential read for anyone interested in the nature of perception the philosophy of mind or the experience of disability It is a groundbreaking work that will challenge your assumptions about sight blindness and the nature of reality itself If you like this book write a review on google books
