Roberts, Nicholas C. Spitzer, Michael J. Zigmond, Darwin Berg, Floyd E. Bloom, Sascha du Lac, Anirvan Ghosh, Larry R. Squire, Susan K. McConnell, 2002-11-19 With over 300 training programs in neuroscience currently in existence demand is great for a comprehensive textbook that both introduces graduate students to the full range of neuroscience from molecular biology to clinical science but also assists instructors in offering an in depth course in neuroscience to advanced undergraduates The second edition of *Fundamental Neuroscience* accomplishes all this and more The thoroughly revised text features over 25% new material including completely new chapters illustrations and a CD ROM containing all the figures from the text More concise and manageable than the previous edition this book has been retooled to better serve its audience in the neuroscience and medical communities Key Features Logically organized into 7 sections

with uniform editing of the content for a one voice feel throughout all 54 chapters Includes numerous text boxes with concise detailed descriptions of specific experiments disorders methodological approaches and concepts Well illustrated with over 850 full color figures also included on the accompanying CD ROM *Neuroanatomy* DOMESICK,NAUTA,2013-04-17 I received my first introduction to the brain sciences in 1936 and 1937 for me the second and third years of the 7 year medical school curriculum at the University of Leiden During those years my interest in the subject was aroused in particular by the brilliant lectures of the physiologist G C Rademaker a prominent former member of the Rudolf Magnus school and the neurohistologist S T Bok noted especially for his histometric studies of the cerebral cortex Fascinated as I was by everything I learned about the brain from these outstanding teachers toward the end of their courses I began to notice conspicuous gaps that separated neurophysiology from neuroanatomy In fact I could or thought I could detect a reasonable concordance between the two sciences only in case of some sensory and somatic motor systems For most other functions anatomical substrates seemed either poorly defined or as in the case of the central viscerocr endocrine system hardly recognized at all With all the arrogance of which a 20 year old student is capable I concluded that what the brain sciences needed was a new and more complete anatomy that emphasized in particular the continuity of and convergences or interconnections between individual conduction systems And I wistfully mused that perhaps at some time in the future I could make such an endeavour part of my own career
