

RETICULOENDOTHELIAL SYSTEM

Reticuloendothelial system or macrophage system is the system of primitive phagocytic cells, which play important role in defense mechanism of the body.

MACROPHAGE

Macrophage is a large cell derived from monocyte. It has the property of phagocytosis. Therefore, the macrophage is also defined as a large phagocytic cell.

CLASSIFICATION OF RETICULOENDOTHELIAL CELLS

The reticuloendothelial cells are classified into two types:

- Fixed reticuloendothelial cells or tissue macrophages
- Wandering reticuloendothelial cells.

FIXED RETICULOENDOTHELIAL CELLS – TISSUE MACROPHAGES

The fixed reticuloendothelial cells are also called the tissue macrophages or fixed histiocytes because these cells are usually located in the tissues.

The tissue macrophages are:

Disorders of the Monocyte Macrophage System F. Schmalzl, D. Huhn, H. E. Schaefer, 2012-12-06 The origin and function of normal monocytes and macrophages have been clearly defined by extensive investigations in human and in animal models The central importance of this cell system for the biological defense mechanisms is well established phagocytosis inactivation and destruction of organic and inorganic materials an important role in the initiation of humoral and cell mediated immunological responses and the secretion of a variety of chemical mediator and effector substances are the most important features of this ontogenetically ancient cell system However the data on this cellular system are rather recent and this may explain why relatively little attention has been paid to the pathology of the monocyte macrophage system MMS until now In addition this monograph should focus attention on the secondary pathological implications of the MMS in disorders not primarily originating from this system Several techniques are available to identify even abnormal individuals of this cell system and therefore can be employed for the study of severely altered or neoplastic monocytic cells
