Retinal Detachment Chad Bruno,2024-02 The retina the light sensitive layer of tissue at the back of the eye can become detached from the underlying layers of the eye causing a dangerous disorder known as retinal detachment The retina s ability to absorb light and convert it into signals that can be delivered along the optic nerve and into the brain is fundamental to visual perception Small tears or holes in the retina are the most prevalent cause of retinal detachment while there are other potential triggers The vitreous a transparent gel like material in the eye can leak through these tears or holes and into the space between the retina and the underlying layers causing vision loss If not addressed immediately this gap might prevent blood and important nutrients from reaching the retina resulting in vision loss or blindness Flashes of light a shadow or curtain like obstruction in the periphery and the abrupt appearance of floaters small specks or cobweb like structures in your field of vision are all symptoms commonly associated with retinal detachment If you encounter any of these signs don t hesitate to contact a doctor right once timely treatment usually in the form of surgery can avoid irreversible damage to your eyes and increase your chances of a full recovery The particular therapy for retinal detachment depends on the nature and severity of the detachment but often involves surgery to reattach the retina and heal any tears or holes It s important to get a full eye exam and start treatment as soon as possible if you suspect you have a retinal detachment or are experiencing symptoms of one Understanding retinal detachment ,1996 *Retinal Detachment Surgery* A.
