**Advances in Inorganic Chemistry**, 1991-05-23 *Advances in Inorganic Chemistry* Biological and Medical Research in Space David Moore, Peter Bie, Heinz Oser, 2012-12-06 Life Science studies in space were initially driven by the need to explore how man could survive spaceflight conditions the effects of being launched under high accelerations exposed to weightlessness and radiation for different periods of time and returned to Earth in safety In order to substantiate the detailed knowledge of potentially adverse effects many model experiments were launched using organisms which ranged from bacteria plants invertebrates rodents and primates through to man Although no immediate life threatening effects were found these experiments can be considered today as the precursors to life science research in space Many unexplained effects on these life forms were attributed to the condition of weightlessness Most of them were poorly recorded poorly published or left simply with anecdotal information Only with the advent of Skylab and later Spacelab did the idea emerge and indeed the infrastructure permit weightlessness to be considered as an extended tool for research into some fundamental mechanisms or processes associated with the

effect of gravity on organisms at all levels The initial hypothesis to extrapolate from hypergravity through 1 x g to near 0 x g effects could no longer be retained since many of the experiment results were seen to contradict the models or theories in the current textbooks of biology and physiology The past decade has been dedicated primarily to exploratory research
