Abstract

In this review article a detailed study is presented on magneto hydrodynamic flows and their importance. Basic concept of MHD is discussed in detail. The results of various researchers are presented and addressed properly.

Keywords: MHD; Basic equations of MHD; Convective flows

Introduction

The interaction of electromagnetic fields and fluids may be described from a scientific point of view, by the proper application of the principles of the special theory of relativity. The practical application of these principles, to actual physical phenomena of engineering, Astrophysics, Geo-physics, etc., is important in recent years. The study of this application to continuum has become known as magneto hydrodynamics or magneto fluid mechanics. The studies of magneto hydrodynamics of viscous conducting fluids play a significant role during the recent times, owing to its practical interest and abundant applications in astro-physical and geo-physical phenomenon. Astrophysicists and geo-phycists realized soon after the advent of special relativity theory that electromagnetic fluid interactions were of great importance in stellar and planetary processes. The main impetus to the Engineering approach to electromagnetic fluid interaction studies has come from the concept of the MHD direct conversion generation, propulsion studies of radio propagation in the ionosphere, and controlled nuclear fusion. The study of flow problems of electrically conducting fluid particularly of ionized gases is currently receiving considerable interest.

Such studies have made for many years in connection with astro-physical and geo-physical such as sun spot theory, motion of the interstellar gas etc. In recent years some Engineering problems need the studies of the flow of an electrically conducting fluid. Devika et al. [1] introduced the problem an analysis of first order homogeneous chemical reaction and heat source on MHD oscillatory flow of a visco-elastic fluid through a channel filled with

saturated porous medium are reported. The present visco-elastic fluid model is working to suggest rheological liquids encountered in biotechnology (medical creams) and chemical engineering. This rheological model introduces additional terms into the momentum equation. It is assumed that the fluid has small electric conductivity and the electromagnetic force produced is very small. The dimensionless governing equations are solved analytically using regular perturbation method. The effects of various parameters on velocity, temperature and concentration fields are presented graphically and discussed. Raju et al. [2] discussed the problem of MHD free convective, dissipative boundary layer flow past vertical porous surface in the presence of thermal radiation, chemical reaction and constant section, under the influence of uniform magnetic field which is applied normal to the surface is studied. The governing equations are solved analytically using a regular perturbation technique. The expressions for velocity, temperature and concentration fields are obtained.

With the aid of these, the expressions for the coefficient of skin friction, the rate of heat transfer in the form of Nusselt number and the rate of mass transfer in the form of Sherwood number are derived. Finally, the effects of various physical parameters of the flow quantities are studied with the help of graphs and tables. It is observed that the velocity and concentration increase during a generative reaction and decrease in a destructive reaction. The same observed to be true for the behavior of the fluid temperature. The presence of magnetic field and radiation diminishes the velocity and also the temperature. Ravikumar et al. [3] studied the

An Introduction to Magneto-fluid Mechanics Vincenzo Consolato Antonio Ferraro, Charles Plumpton, 1966

Magneto-Fluid Dynamics Paul Lorrain, Francois Lorrain, Stephane Houle, 2007-10-31 Magnetohydrodynamics MHD concerns the interaction between magnetic fields and conducting fluids We are concerned here with macroscopic interactions and when the conducting fluid is a plasma time scales are very much longer than the plasma period Plasma periods vary widely but are short say 10 second We prefer the term Magneto F i Z i Dynamics MFD because the discipline concerns mostly plasmas various liquid conductors and the liquid part of the Earth's core It seems that the only applications of MFD to water are the induction of electric currents in the oceans by the Earth's magnetic field and ship propulsion But even MFD is not quite appropriate because that term also includes solid conductors that move in magnetic fields This book is meant for graduate and upper division undergraduate students in Physics Geophysics and Astrophysics as well as for practicing scientists in these fields This book is no more than a brief introduction to MFD because this vast subject is closely related to many others namely Astrophysics Electrodynamics Fluid Dynamics Geophysics Oceanography Plasma Physics Thermonuclear Fusion etc We sketch the fundamentals and provide many Examples as well as Case Studies related to natural phenomena MFD sorely needs a rethink it must of course be totally compatible with Physics On the contrary it is the custom to discuss the shapes of imaginary magnetic field lines without ever referring to the required electric currents

Conservation Laws Gary Webb, 2018-02-05 This text focuses on conservation laws in magnetohydrodynamics gasdynamics and hydrodynamics A grasp of new conservation laws is essential in fusion and space plasmas as well as in geophysical fluid dynamics they can be used to test numerical codes or to reveal new aspects of the underlying physics e g by identifying the time history of the fluid elements as an important key to understanding fluid vorticity or in investigating the stability of steady flows The ten Galilean Lie point symmetries of the fundamental action discussed in this book give rise to the

conservation of energy momentum angular momentum and center of mass conservation laws via Noether's first theorem The advected invariants are related to fluid relabeling symmetries so called diffeomorphisms associated with the Lagrangian map and are obtained by applying the Euler Poincare approach to Noether's second theorem The book discusses several variants of helicity including kinetic helicity cross helicity magnetic helicity Ertels theorem and potential vorticity the Hollman invariant and the Godbillon Vey invariant The book develops the non canonical Hamiltonian approach to MHD using the non canonical Poisson bracket while also refining the multisymplectic approach to ideal MHD and obtaining novel nonlocal conservation laws It also briefly discusses Anco and Bluman's direct method for deriving conservation laws A range of examples is used to illustrate topological invariants in MHD and fluid dynamics including the Hopf invariant the Calugareanu invariant the Taylor magnetic helicity reconnection hypothesis for magnetic fields in highly conducting plasmas and the magnetic helicity of Alfvén simple waves MHD topological solitons and the Parker Archimedean spiral magnetic field The Lagrangian map is used to obtain a class of solutions for incompressible MHD The Aharonov Bohm interpretation of magnetic helicity and cross helicity is discussed In closing examples of magnetosonic N waves are used to illustrate the role of the wave number and group velocity concepts for MHD waves This self contained and pedagogical guide to the fundamentals will benefit postgraduate level newcomers and seasoned researchers alike **Magneto-fluid Dynamics** François N.
