Radiation Transport In Spectral Lines Geophysics And Astrophysics Monographs:

Radiation Transport in Spectral Lines R.G. Athay, 1972-12-31 The usual book on the theory of spectral line formation begins with an in depth discussion of radiation transfer including the elegant methods of obtaining analytical solutions for special cases and of the physics of line broadening Neither of those features will be found in this book It is assumed that the reader is already familiar with the essentials of transport theory and of line broadening and is ready to investigate some of the particular applications of the theory to the flow of line photons through the outer layers of a star or other tenuous media The main thrust of this book is toward the compilation and presentation of a vast quantity of computational material available to the author in the form of computer output The material presented represents a highly filtered sample of the published work in this subject plus an extensive set of previously unpublished results To present large quantities of computer output in an intelligible and efficient way is a difficult task for which I have found no really satisfactory solution Chapters III and IV in particular contain almost exclusively this type of presentation The reader may find these chapters somewhat tedious because of the level of condensation of the material I have tried to reach a reasonable balance between over condensation and excessive detail which in the long run may be irrelevant

Kourganoff, 2012-12-06 The purpose of this textbook is to provide a basic knowledge of the main parts of modern astrophysics for all those starting their studies in this field at the undergraduate level The reader is supposed to have only a high school training in physics and mathematics In many respects this Introduction to Advanced Astrophysics could represent a volume of the Berkeley Physics Course Thus the primary audience for this work is composed of students in astronomy physics mathematics physical chemistry and engineering It also includes high school teachers of physics and mathematics Many amateur astronomers will find it quite accessible In the frame of approximations proper to an introductory textbook the treatment is quite rigorous Therefore it is also expected to provide a firm background for a study of advanced astrophysics on a postgraduate level A rather severe selection is made here among various aspects of the Universe accessible to modern astronomy This allows us to go beyond simple information on astronomical phenomena to be found in popular books and to insist upon explanations based on modern general physical theories More precisely our selection of topics is determined by the following considerations The study of the solar system the Moon and the planets has recently progressed at a tremendous rate However the very rich harvest of observations provided by space research is mainly purely descriptive and is perfectly presented in review papers of Scientific American Science Physics Today and similar magazines **Introduction to Solar Radio Astronomy and Radio Physics** A. Krüger, 2012-12-06 1 1 Short History of Solar Radio Astronomy Since its birth in the forties of our century

solar radio astronomy has grown into an extensive scientific branch comprising a number of quite different topics covering technical sciences astrophysics plasma physics solar terrestrial physics and other disciplines Historically the story of radio astronomy goes back to the times of James Clerk Maxwell whose well known phenomenological electromagnetic field equations have become the basis of present time radio physics As a direct consequence of these equations Maxwell was able to prognosticate the existence of radio waves which fifteen years later were experimentally detected by the famous work of Heinrich Hertz 1887-88 However all attempts to detect radio waves from cosmic objects failed until 1932 which was mainly due to the early stage of development of receiving techniques and the as yet missing knowledge of the existence of a screening ionosphere which was detected in 1925 Therefore famous inventors like Thomas Edison and A E Kennelly as well as Sir Oliver Lodge were unsuccessful in receiving any radio emission from the Sun or other extraterrestrial sources Another hindering point was that nobody could a priori expect that solar radio emission should have something to do with solar activity so that unfortunately by chance some experiments were carried out just at periods of low solar activity This was also why Karl Guthe Jansky at the birth of radio astronomy detected galactic radio waves but no emission from the Sun

Extragalactic Astronomy J.L. Sérsic, 2012-12-06 This book is an outgrowth of the notes made for the semester lectures on Problems of Extragalactic Astronomy given almost annually during two decades at the Observatorio Astronómico of the Universidad de Córdoba Shorter versions were also given at La Plata Santiago de Chile São Paulo Rio de Janeiro and Paraíba E Scalise made a Portuguese language version of the notes and encouraged me to publish them although my friend J Kleczek is to be blamed for the idea of this book Not every subject on Extragalactic Astronomy has been touched in this book instead I have followed those which interested me during 25 years of professional practice in this part of the world I acknowledge helpful suggestions from M Pastoriza and G Carranza the comprehension of Director L Milone and the collaboration of the staff of the Observatory in Córdoba R Tschamler's humor and wit made light the task of producing the English version and M Pizarro's devotedness produced the edited MS To both of them I am in deep gratitude A book is published out of necessity otherwise the author would spend his entire life polishing the originals was the answer given by J L Borges to an inquisitive journalist These words explain why this book is so different from the lecture notes and also from the book I was hoping for I thank B McCormac and the D Reidel Publ Co for my salvation from Borges' inferno

Ionospheric Techniques and Phenomena A. Giraud, M. Petit, 2012-12-06 If our eyes were radio rather than optical wide band detectors it is well known that for us the brightest object in the sky would still be the Sun that planets stars and the Milky Way would still shine feebly and that we would still occasionally be blinded by man made sources What is less well known is that quite a different earthbound overcast would hover about us with its climatic zones its seasonal changes its unpredictable storms and scintillating transparency To be sure we can get a sort of glimpse of this peculiar type of weather when we tune our receiver to radio broad casting from some remote spot or photograph the Earth from space at certain specific wavelengths Nevertheless no one has ever looked at the ionized shroud of the Earth without the help of sophisticated apparatus and this is one of the reasons why in this domain the phenomena are not easily abstracted from the use of specific techniques For generations the study of the ionosphere has been deeply interwoven with the practice of radio communication and detection Today however ionospheric physics is best thought of as a branch of space physics that part of physics which deals with processes at work in the solar system and methods developed for its exploration **Literature 1972, Part 2** S. Böhme, W. Fricke, U. Güntzel-Lingner, F. Henn, D. Krahn, U. Scheffer, G. Zech, 2013-04-18 Astronomy and Astrophysics Abstracts which has appeared in semi annual volumes since 1969 is devoted to the recording summarizing and indexing of astronomical publications throughout the world It is prepared under the auspices of the International Astronomical Union according to a resolution adopted at the 14th General Assembly in 1970 Astronomy and Astrophysics Abstracts aims to present a comprehensive documentation of literature in all fields of astronomy and astrophysics Every effort will be made to ensure that the average time interval between the date of receipt of the original literature and publication of the abstracts will not exceed eight months This time interval is near to that achieved by monthly abstracting journals compared to which our system of accumulating abstracts for about six months offers the advantage of greater convenience for the user Volume 8 contains literature published in 1972 and received before March 15 1973 some older literature which was received late and which is not recorded in earlier volumes is also included Turbulent Diffusion in the Environment G.T. Csanady, 2012-12-06 The rather excessive public preoccupation of the immediate past with what has been labeled the environmental crisis is now fortunately being replaced by a more sustained and rational concern with pollution problems by public administrators engineers and scientists It is to be expected that members of the engineering profession will in the

future widely be called upon to design disposal systems for gaseous and liquid wastes which meet strict pollution control regulations and to advise on possible improvements to existing systems of this kind The engineering decisions involved will have to be based on reasonably accurate quantitative predictions of the effects of pollutants introduced into the atmosphere ocean lakes and rivers A key input for such calculations comes from the theory of turbulent diffusion which enables the prediction of the concentrations in which pollutants may be found in the neighborhood of a release duct such as a chimney or a sewage outfall Indeed the role of diffusion theory in pollution prediction may be likened to the role of applied mechanics strength of materials in the design of structures for adequate strength At least a certain group of engineers will have to be proficient in applying this particular branch of science to practical problems At present training in the theory of turbulent diffusion is available only at the graduate level and then only in a very few places

Gamma-Ray Astronomy E.L.

Chupp,2012-12-06 Observation of discrete energy electromagnetic emissions from celestial objects in the radio IR optical IN and X ray spectral regions has dramatically advanced our knowledge in the field of astrophysics It is expected that identification of nuclear γ ray line emissions from any cosmic source would also prove to be a powerful new tool for probing the Universe Since the publication of Morrison's work in 1958 many experiments were carried out searching for evidence of γ ray lines from cosmic sources however with little success Only a few positive experimental results have been reported in spite of an expenditure of considerable effort by many people in particular the possible Galactic Center emission line 473 to 530keV and γ ray lines at several energies e.g 0.5 MeV and 2.2 MeV associated with large solar flares Both of these observations are unconfirmed by independent observations ca 1975 The high energy γ rays 30MeV from the Galactic Center are at least partly due to the decay of π^0 mesons which are of unique energy 67.5 MeV in the π^0 rest frame only The reasons for the limited amount of data available in this field even though early theoretical predictions were very optimistic regarding fluxes of nuclear lines are that experimental efforts are plagued with high backgrounds and low fluxes and that development of instruments with telescopic properties in the energy range of interest is difficult

The Moon in the Post-Apollo Era Zdenek Kopal,2012-12-06 The aim of the present book will be to summarize the results of the space exploration of the Moon in the past fifteen years culminating in the manned Apollo missions of 1969-1972 on the background of our previous acquaintance with our satellite made in the past by astronomical observations at a distance Astronomy is one of the oldest branches of science conceived by the inquisitive human mind though until quite recently it had been debarred from the status of a genuine experimental science by the remoteness of the objects of its study With the sole exception of meteoritic matter which occasionally finds its way into our laboratories all celestial bodies could be investigated only at a distance namely from the effects of attraction exerted by their mass or from the ciphered messages of their light carried by nimble footed photons across the intervening gaps of space A dramatic emergence of long range

spacecraft capable of carrying men with their instruments not only outside the confines of our atmosphere but to the actual surface of our nearest celestial neighbour has since 1957 thoroughly changed this time honoured picture In particular as we shall detail in Chapter 1 of this book space astronomy of the Moon is barely 15 years old But relative infant as it is by age it has already provided us with such a tremendous amount of new and previously inaccessible scientific data as to virtually revolutionize our subject

Atmospheric Thermodynamics J. V. Iribarne, W. L. Godson, 2013-03-09 The thermodynamics of the atmosphere is the subject of several chapters in most textbooks on dynamic meteorology but there is no work in English to give the subject a specific and more extensive treatment In writing the present textbook we have tried to fill this rather remarkable gap in the literature related to atmospheric sciences Our aim has been to provide students of meteorology with a book that can play a role similar to the textbooks on chemical thermodynamics for the chemists This implies a previous knowledge of general thermodynamics such as students acquire in general physics courses therefore although the basic principles are reviewed in the first four chapters they are only briefly discussed and emphasis is laid on those topics that will be useful in later chapters through their application to atmospheric problems No attempt has been made to introduce the thermodynamics of irreversible processes on the other hand consideration of heterogeneous and open homogeneous systems permits a rigorous formulation of the thermodynamic functions of clouds exclusive of any consideration of microphysical effects and a better understanding of the approximations usually implicit in practical applications

The Light of the Night Sky F. E. Roach, 2013-03-09 Astronomy appears to us as a combination of art science and philosophy Its study puts the universe into perspective giving a sense of pleasure in its beauty awe at its immensity and humility at our trivial place in it From earliest human history man has scrutinized the night sky and wondered and marveled With unaided eye but perceptive mind he recognized order in the regular appearance and movements of individual objects such as the planets and star groups constellations in their rhythmic and majestic progressions across the bowl of night Even in the present era of scientific exactitude there remains a profound awareness of mysteries beyond our present interpretations It is only in comparatively recent years however that man has recognized that it takes more than conventional astronomy to account for the beauties of the night sky Radiations in the Earth's upper atmosphere provide a foreground light the study of which has come under a new name aeronomy The science of aeronomy has rapidly burgeoned and the student of the light of the night sky finds that he is involved in an interdisciplinary domain
