Radiative Transfer In Scattering And Absorbing Atmospheres:

Radiative Transfer in Scattering and Absorbing Atmospheres Jacqueline Lenoble, 1985 *Radiative Transfer in the Atmosphere and Ocean* Gary E. Thomas, Knut Stamnes, 2002-01-28 Provides a foundation of the theoretical and practical aspects of radiative transfer for the atmospheric oceanic and environmental sciences *Atmospheric Radiation* James A. Coakley Jr., Ping Yang, 2014-06-26 This textbook is a first look at radiative transfer in planetary atmospheres with a particular focus on the Earth's atmosphere and climate. It covers the basics of the radiative transfer of sunlight treating absorption and scattering and the transfer of the thermal infrared. The examples included show how the solutions of the radiative transfer equation are used to evaluate changes in the Earth's energy budget due to changes in atmospheric composition how these changes lead to climate change and also how remote sensing can be used to probe the thermal structure and composition of planetary atmospheres. The examples motivate students by leading them to a better understanding of and appreciation for the computer generated numerical results. Aimed at upper division undergraduates and beginning graduate students in physics and atmospheric sciences the book is designed to cover the essence of the material in a 10 week course while the material in the optional sections will facilitate its use at the more leisurely pace and in depth focus of a semester course.

Radiative Transfer in the Atmosphere and Ocean Knut Stamnes, Gary E. Thomas, Jakob J. Stamnes, 2017-07-13 This new and completely updated edition gives a detailed description of radiative transfer processes at a level accessible to advanced students. The volume gives the reader a basic understanding of global warming and enhanced levels of harmful ultraviolet radiation caused by ozone depletion. It teaches the basic physics of absorption scattering and emission processes in turbid media such as the atmosphere and ocean using simple semi-classical models. The radiative transfer equation including multiple scattering is formulated and solved for several prototype problems using both simple approximate and accurate numerical methods. In addition the reader has access to a powerful state of the art computational code for simulating radiative transfer processes in coupled atmosphere water systems including snow and ice. This computational code can be regarded as a powerful educational aid but also as a research tool that can be applied to solve a variety of research problems in environmental sciences. *Wave Scattering in Complex Media: From Theory to Applications* Bart A. van Tiggelen, Sergey E. Skipetrov, 2012-12-06 A collection of lectures on a variety of modern subjects in wave scattering including fundamental issues in mesoscopic physics and radiative transfer recent hot topics such as random lasers liquid crystals left-handed materials and time reversal as well as modern applications in imaging and communication. There is a strong emphasis on the interdisciplinary aspects of wave propagation including light and microwaves acoustic and elastic waves propagating in a variety of complex materials liquid crystals media with gain natural media magneto-optical media photonic and phononic materials etc. It addresses many different items in contemporary research mesoscopic fluctuations localization radiative transfer symmetry aspects and time reversal. It also discusses new potential applications in telecommunication soft
