Fins into Limbs Brian K. Hall, 2008-09-15 Long ago fish fins evolved into the limbs of land vertebrates and tetrapods. During this transition some elements of the fin were carried over while new features developed. Lizard limbs, bird wings, and human arms and legs are therefore all evolutionary modifications of the original tetrapod limb. A comprehensive look at the current state of research on fin and limb evolution and development. This volume addresses a wide range of subjects including growth, structure, maintenance, function, and regeneration. Divided into sections on evolution, development, and transformations, the book begins with a historical introduction to the study of fins and limbs and goes on to consider the evolution of limbs into wings as well as adaptations associated with specialized modes of life such as digging and burrowing. *Fins into Limbs* also discusses occasions when evolution appears to have been reversed, in whales for example whose front limbs became flippers when they reverted to the water, as well as situations in which limbs are lost, such as in snakes. With contributions from world renowned researchers, *Fins into Limbs* will be a font for further investigations in the changing field of evolutionary developmental biology.

Pertinent and detailed information resources and references are proliferating rapidly while the quantity of patient data gathered during an episode of care can be daunting.

Identifying the best guideline and interventions which will lead to an optimal clinical outcome for an individual patient poses an increasingly difficult challenge Matching the detailed information about a particular patient with the parameters of a guideline may be tedious Attempting to identify or use a guideline with terms of definitions which differ from those found in a patient's record may well be impossible Here we confront the well known medical vocabulary problem which plagues nascent efforts to establish electronic medical records EMRs everywhere Efficient resource management and the adoption of cost effective strategies are of increasing importance in the new market realities of healthcare in the late 90's Whether providers seek to describe their practice implement continuous improvement engage in outcomes research or develop data driven guidelines a way to represent patient findings and events consistently is required The standard classifications for administrative data in healthcare such as ICD 9 CM have proven to be too coarse for a detailed examination of practice patterns and severity adjusted outcomes The use of free text to represent diagnoses and procedures is unwieldy unstructured free text cannot support information linkage and analyses without elaborate machine processing or hand abstraction and coding
